Preface

This book is written according to the current scenario of COVID-19 in different parts in India, keeping in mind the needs of the learners. To meet the needs of the learners, COVID-19 has been prepared in a comprehensive manner. We have tried to highlight various strategies on COVID-19 in this book. In this book various thoughts of authors are discussed only where they have tried to cover each and every aspect of COVID-19 in India. The total book is being segregated in titles as suggested by authors so that a holistic learning can be attained by the readers.

The total comprehensive coverage of this book is quite sufficient to help the readers to acquire expected learning outcome on COVID-19 properly. We are really thankful to the authors during the composition of this book. We have also followed different experts' suggestion in this arena. While editing this book, we have taken utmost care and attention to furnish materials in conformity with the present scenario to make it a full-fledged book according to the needs of the present day students.

It would not be exaggerated in this behalf to utter special words of thanks due to all well-wishers for their wholehearted endeavour and kind cooperation in the successful completion of this book. We owe to their blessings, inspiration and continuous support. We also remember the patronages of those who have rendered immense help and support either directly or indirectly in completion of this book timely.

Last but not the least, we extend our note of thanks to the publisher N. B Publications, Ghaziabad for publishing this book within his hasty hours. Any valuable suggestion from distinguished professors, teachers and learners in this field would be highly solicited.

Foreword

I have the privilege of forewarding a book under the caption **“COVID-19: APPROACH TO NEW NORMAL”** initiated by Dr. Kishore Mondal, Assistant Professor, Rishi Aurobindo Institute of Teacher education, Paschim Medinipur and Miss Sulagna Chakraborty, Assistant Professor, Rishi Aurobindo Institute of Teacher education, Paschim medinipur to focus public attention on COVID-19 through **“knowledge”** on people in India to empower them in such pandemic situation particularly, its methods and above all in decision making for themselves, family, and society. In such a situation a wide ranging churning of ideas and expectations were reflected by the endeavour of Academicians, Researchers, Teachers, Policy Makers, and Writers who have expertise in the field of social science education in college and university students in this Globalised world, through the critical conduit of ISBN number under my strict vigil.

Development is the process of becoming stronger and more confident, especially in controlling one's life and claiming one's rights, enabling to develop their unique abilities of thinking, taking action and controlling work in an autonomous way, the mechanism by which people, organizations, and communities gain mastery over their lives. Unfortunately for a long time in our socially isolated society, pandemic concepts have been neglected from all corners. COVID-19: Approach to New normal shall be major knowledge producer for both the educated youth and civil society, as the educated youth play a very important role in the development of the country. It is one of the most important instruments of empowering the youth to enhance their knowledge, skills and self-reliance needed to participate fully in national development. It is a milestone of development of youth that may bring a reduction in their inability to compete in the globalised world.

(viii)

The rich and comprehensive nature of this document would not have been achieved without a special ignition that enveloped all those who got involved. I do not know who struck the spark, perhaps it is no one in particular.

I do not feel daunted by the task; rather I feel it is doable. I hope this effort might start a freedom movement for the educational upliftment at pan India level in on education concepts to empower the readers in each and every cell of life.

Prof. Dr. Jayanta Mete

MESSAGE

It is my great pleasure to congratulate the International Webinar team for organizing such a knowledgeable webinar in this pandemic situation. It gives me a sense of relief that all our faculty members are performing their duty religiously. Knowledge cannot be imparted only within the four walls of the room. This pandemic situation has taught us a lesson that when there is a will there is a way. In this globalized world through the medium of technology we are able to connect with each other and can continue our teaching learning situation.

It is also to be noted that with the increasing competency of our faculty members such an International webinar is possible.

We always think of the metro cities of the world but half of the population of each country still exist in the remote villages. Technology has not enlightened them. They still live with lantern in every night. So, at this juncture I want to raise an open question to you all, does we expect students from such villages will be able to use ICT enabled technologies for learning in this pandemic situation? The answer is no. So, what is use of it? Benefit of learning through technology must be availed by all. So, why there is an unequal distribution of facilities among the two sectors of students. The government must take this matter with utmost care so that a knowledge based society can be framed. Moreover, it is observed that we both the teachers and the learners are more convenient in the traditional and convenient system of education where face to face interaction can be made possible. India's heritage Gurukul

(x)

system of education is also based on this concept. Unless and until strong bondage can be made possible between the teachers, the student, learning cannot be made successful.

I thankful to all my faculty members for publication of this book. I wish from the core of my heart for successful publication of this book and also expect soon we will be back to our traditional classroom situation.

COVID-19: PROBLEMS AND SOLUTIONS IN THE WORLD

Arnab Chowdhury & Jayanta Mete

Abstract

COVID-19 disease outbreak was started in the December, 2019 in the Wuhan city of China which is also known as the largest transportation hub of China. During the spring festival of China the situation become epidemic. Soon, the virus is imported to many regions including the low income countries. Till now, 234073 infected reported cases of the COVID-19 in the world with the total of 9840 deaths (March 20, 2020). The common symptoms of the COVID-19 are the cough, high fever, sore throat, fatigue and breathlessness. The disease is found to be mild in most of the people, some of cases reported to the pneumonia also with multi organ dysfunction and acute ARDS (acute respiratory distress syndrome). It is found that the incubation period for the infection is 2-14 days which is usually 4 days in maximum of cases. India has reported 283 cases of COVID-19 infections till now with 4 deaths. India is still at stage 2 on local transmission as per WHO report 60. WHO reported 60 clearly stated that there is no community transmission occurred in India yet which can be prevented by the avoiding mass gathering and proper screening of the people. Govt. of India has taken many initiatives to minimize the spread of COVID-19 infection in the country. The infection rate of the COVID-19 in India remains low related to population size of the country. It is because of fast government action to quarantine the suspected people and shut down all its borders.

There is a great slowdown in the global economy due to COVID-19 attack which is likely to cost around \$1 trillion. The spread of COVID-19 infection can be reduced by minimizing the H-H transmissions. Still there is need of Anti-n-CoV drug development which can replace the supporting therapies for the treatment of infection.

Keywords: COVID-19; Coronavirus; SARS CoV, SARS CoV-2; novel CoV; India.

Introduction

Coronavirus (COVID-19) is one of the infectious diseases at present time which is caused by new virus. The Corona virus was firstly characterized in 1960 with the symptoms of respiratory illness like the common cold identified by Canadian study 2001 in which approximately 500 patients were identified with the symptoms of virus and among them 17-18 cases were infected with corona virus strain with the polymerase chain reaction. The earliest virus was identified known as infectious bronchitis virus which was in chicken and found in the patients also with the symptoms of common cold latterly considered as Human coronavirus OC43 and Human coronavirus 229E. With the time other members of this virus family were identified namely, SARS coronavirus in 2003 (9% infected patients died rate), Human coronavirus NL63 in 2004 (mild to moderate upper infection in the respiratory system), HKU1 in January, 2005 in the 2 patients of Hong Kong, MERS coronavirus in 2012 in Saudi Arabia with the similar flu like symptoms and SARS coronavirus-2 (COVID-19) in 2019 with most commonly symptoms of respiratory tract infections and common cold. First case of coronavirus (COVID-19) was observed in the Wuhan city of China. Wuhan, Hubei province of China is considered as the origin for the life threatening viral outbreak of Novel COVID-19. Till 2002 coronavirus was considered as the non-fatal virus. In 2003 various health reports published among the globe have reported the spread of the coronavirus in the various countries i.e. Singapore, United States of America, Hong Kong, Vietnam, Taiwan and Thailand. COVID-19 was recognized as pandemic by WHO on the March-11, 2020. As of the March-21, 2020 around 276000 people are infected with

COVID-19 virus in 180 countries with 88,000 recoveries and 11,300 deaths. The transmission of virus from one human to another is due to the respiratory droplets which are produced due to the coughing. The disease is transferred to another person by contact or inhalation with the infected droplets having the incubation period of two to fourteen days. India has reported 219 confirmed COVID-19 cases including 39 foreign national confirmed cases with 4 deaths and 23 recoveries. The aim of the present article is to give eye view of new identified virus. This article will help the low income countries to update the facts on COVID-19 and help them in the prevention from the infection.

Origin and Spread of new coronavirus (COVID-19)

First case of coronavirus (COVID-19) was observed in the Wuhan city of China. Wuhan, Hubei province of China is considered as the origin for the life threatening viral outbreak of Novel COVID-19. Wuhan is the capital city of Hubei province which is also known as the one the major transportation hub in the China started serving the hospitals in their local regions with the pneumonia with unknown causes. The initial was traced with some of common exposures to the wholesale seafood market in Wuhan city which is also known for trading the living animals. After the SARS outbreak surveillance system was activated and respiratory related samples of suspected patients were sent to the labs for the investigations. China notified the outbreak to WHO on December-31, 2019 and on January 1, 2020 seafood market of Huhan was closed till further notice. On January 7, 2020 it is found that coronavirus has the >70% homogeneity with SARS-CoV and >95% with the bat coronavirus [8]. Reports came from the Huanan also showed the positive result which clarifies that coronavirus was originated from the Wuhan city. Soon the number of cases stated increasing exponentially. Generally the virus having four stages has shown in the Figure 1.

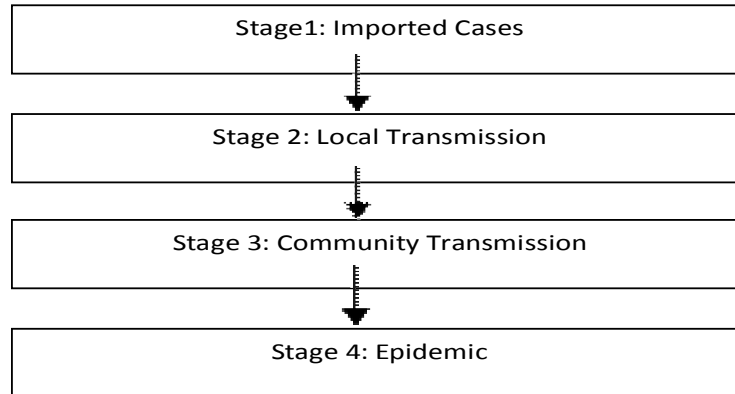

Figure 1: Four stages of COVID-19

Soon, the people who were not visited to animal market infected due to the human to human transmission which converted into the community transmission and Epidemic. China reported its first fatal case on January 11, 2020. Cases were reported in the other countries (South Korea, Japan and Thailand) and provinces of China in very short time in people who visited or returned from the Wuhan city during the outbreak. China government decided to lockdown the 11 million population of Wuhan city on January 23, 2020 with the restrictions for entry and exits from the Wuhan city. Due to the virus spread over Hubei province other cities were also lockdown. Airports of the different countries put the screening mechanisms to detect the infected people so that infected people returning from China can be detected and put into isolation till not tested or recovered from COVID-19. Countries like India who evacuated their citizens from the Wuhan city of other province from China by the special flights put the people in isolation for 14 days and tested for the COVID-19. Cases started increasing exponentially soon with the epidemic doubling time of 1.8 days in China. On February 12, 2020 China reported 2022 new cases in a single day. Also, 712 more people infected in the cruise ship named Diamond princess which was parked on the coast of Japan, in which 7 people are died. It is found that number of cases in China stated reducing with time but soon the number of cases started increasing exponentially in other countries

like Italy, South Korea, United States of America, Thailand and Iran. At present as of (March 20, 2020) 2, 34,073 people are infected with COVID-19 in which 24247 are new cases with 9840 total deaths and 1061 new deaths.

Microbiology of Coronavirus

Coronavirus causes the acute and mild upper respiratory infections. Structure of coronavirus is spherical or pleomorphic enveloped particles which contains the single stranded RNA (Mr 6×10⁶). In the structure RNA are associated with nucleoprotein. The sub types of the coronavirus are an Alpha, Beta, Gamma and Delta virus which consists of the many serotypes. Not all the coronavirus affect the humans some of them affect to human i.e. 229E-like and OC43-like and some affects the animals such as cats, pigs, mice and birds.

Epidemiology

As the virus is infecting at the very fast rate and still there is no vaccination is available for the COVID-19 so all the ages are susceptible. In the December, 2019 many pneumonia cases were found in the Wuhan City and latterly it found that the source of the infection was Huanan seafood market. The samples were collected and etiologic investigations were carried out in the patients having the similar viral symptoms. On January 22, 2020 CoV has been declared as a virus which was originated from the wild bats and belonging to the SARS-CoV because both the COVID-19 and SARS-CoV having the same beta coronavirus subgroup.

Modes of Transmission

Understanding of the transmission risk is still incomplete. Epidemiologic investigation from the Wuhan city at the beginning of the COVID-19 outbreak identified an initial association with the Huanan seafood market where the most of patients have visited [26]. However, human to human transmission was the main mode of infection transmission which is spread by the large respiratory droplets caused by sneezing and coughs.

Current available literature studies on COVID-19

COVID-19 was firstly observed in December, 2019 so there is

less literature available on the infection. Also, the currently available treatments for the COVID-19 include the ventilation and intensive care. WHO has already accelerated the R&D to accelerate the vaccines, diagnostics and therapeutics. (Ralph et al. 2020) explained the role of human to human transmission, vaccine readiness and cases related to travel history in the n-CoV infection. (Lu et al. 2020)

Prevention from COVID-19

Since till now there is no vaccine available for this infection and also there is no approved treatment is provided by any health organization the prevention of this infection at the early stages are crucial. People suffering with the chronic underlying disease are at higher risks from the infection of COVID-19 which may cause death. The largest population country like China where the total of 16% patients was developed the severe disease with the 8.1% mortality rate. In all patients with the severe disease the co-morbidities percentage was 38.7%. People with co- morbidities diseases require more precautions and preventions from the COVID-19.

Initiatives Taken by Govt. of India

Govt. of India has taken many initiatives to minimize the spread of COVID-19 infection in the country. As India is the world second largest populated country but till now only 283 cases have been reported in the India. The infection rate of the COVID-19 in India remains low related to population size of the country. It is because of fast government action to quarantine the suspected people and shut down all its borders. Indian government is screening all the international travellers at the airport to avoid the spread of the infection.

Conclusion

The new COVID-19 virus outbreak has challenged the medical, economic and public health infrastructure of many countries especially the China, Italy, Iran and Japan. The origin of n-CoV can be traced from the Huanan seafood market of the Wuhan city China. Spring festival of China provides the favourable conditions for the virus spread as Wuhan city is known as the largest transportation hub of China. Till now there is no authorized vaccination is available for the treatment of COVID-19. It is found that the incubation period

for the infection is 2-14 days which is usually 4 days in maximum of cases.

Impact of Pandemic on Economic Prospects for Global and Indian Economy

Dr. Manoj Kumar Mishra Dr. Vikas Deepak Srivastava

Abstract

Human aspirations for growth and development and Pandemic origin and geometric progression have been running side by side since dawn of human civilization. The novel COVID pandemic seem to have outperformed the uncountable damages of mankind occurred in past, marked as black day of human history. The unexpected strike of this pandemic has led to all-round ripples in economic and social system of all countries of world, reinforcing fear of long phase of global recession on anvil. In this paper, the shocks and spillovers of global health crisis on global economy as a whole taking into account the economic drivers of global economy as per their significance and impacted to global shutdowns triggered by COVID-19 and short run and long run perspective of global economy, is arguably debated. The current and potential impacts of global health hazard have also been attempted in case of Indian economy by drawing conceptual and statistical inferences on major drivers of Indian economy.

Keywords: *Pandemic, Global Recession, Financial Markets, Growth Disruptions etc.*

I. Introduction:

World economy was still braving long-stretched global recession post burst of world financial markets bubble and making endeavors for full recuperation from sores of economic meltdown then suddenly COVID-19 pandemic tiptoed severely, hitting down each and every

corners of global topography. The notion of sustainable development has already taken up with renewed spirits at helm of growth drivers of world economy ,the north pole of economic development school of thought and policy initiatives for correction targeted at prevalent,almost obsolete economic orders had taken a shape but outbreak of world malign change of health crisis in form of COVID-19 is expected to weigh down all these efforts and it is also feared that world is now hurtling back to witness another black hole of economic distress characterized by widespread hunger, unemployment, perished industry, trade, commerce, widening disparity of income and power again and high degree of social chaos , refreshing the black memories of situation during and post-world wars.

The global output is projected to shrink by enormous magnitude in successive years and during pandemic proliferation, tumbled at historic low since post Second World War shocks and uncertainties. Given the fact that mutation phase of COVID19 is still on rise with daily record breaking confirmed cases and alarming rising numbers of deceased succumbed to COVID infection especially in developing countries at later phase of spike, This global pandemic has reignited the more effective and constructive policy responses, aiming to make health and medical system more robust to reduce magnitude of shocks and consequent spill over on vulnerable sectors of economy like agriculture, MSME, and informal participants of economy to protect from outright challenges and volatilities in income, employment, demand and supply chain.

There are variety of propositions and statistical inductions are being carried to weigh the severity, quantum of current impacts and long term perspective of global economy in general and countries wise and region wise impacts of global health crisis. The giants of humanitarian crisis that has already become a chronic stigma in third world economies, moving parallel to odds of economic crisis, is projected to deteriorate much more in severity, gravity and quantum. The fatalities of human lives caused by this pandemic too exhibit uneven sprawling with larger reported cases and resultant mortalities in growth cradle of world economies and later spurt but gradual backwash impacts on less developed pockets of world like African

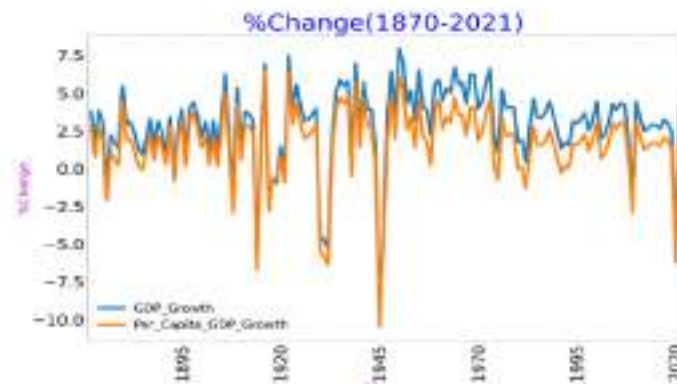

and Asian countries. Thus, it appears mockery of nature, whipping hard on countries with silver spoon USA, France, Italy, UK that have been more accountable in game of recklessly tinkering with mother nature in their unending quest for biased development. This worldwide crisis has less or more forced the North and South world economies to rope together on a platform to mitigate the unimaginable ripple effects via way of statistical perspective in data gathering and unrestricted sharing across countries for sake of humanity. Though, this research is step to highlight some of contagion effects on world economy in general and Indian economy in particular by unfolding the structure of socio-economic matrix. Even, though it's a bit early to deliberate over COVID long term macro-economic outlook with logical nicety, given its speculative gestation periods varied countries to countries. Further down, the impacts of COVID are discussed in detail on global economy and its macro and micro models in line of degree of distress and pandemic triggered humanitarian upheaval at all length and breadth and corrective measures for revival of economy are too put up at center of deliberations.

II Performance and Prospect of World Economy: Pre and Post COVID

The much sensational debate over Economic growth and Development that used to be page three attractions for developing nations till epoch making era of structural reforms sponsored by world monetary and financial clouts in packages of economic liberalization seems to have rejuvenated in COVID ordeal era. Are we truly moving in right path of sustainable development, where prosperity of one is voluntarily causative to common good? The twentieth century has privilege to witness long trajectory of uptrend of economic growth and post liberalization periods, Asian game changer India and China too were splashing round good track records of growth rates. China has been able to capture the double digit growth scores for long period in compared India where consistency in strong growth rates has been less apparent. Even, the renewed foundation of world economic prosperity was overhung on fragile short run movements of financial assets, looking for high returns that were exposed by great financial crisis of 2007-09. It has opened the new dimension of deliberation that how local currencies play out the dominance of basket of hot

currencies. The pie of total commercial borrowings in developing nations from international financial markets stood at round 34% to total cross countries circulating financial chunks and claimed to support some of mega developmental projects in southern hemisphere. The episode of wear and tear phase for developing and least players of world economy is projected to turn into ice age of deep economic hibernation with strong prospect of scrapping away all resources for economic and social calibration.

Chart 1: Global GDP and Per Capita GDP

Source: Calculated from World Bank: Report on Global Economic Prospects, June, 2020.

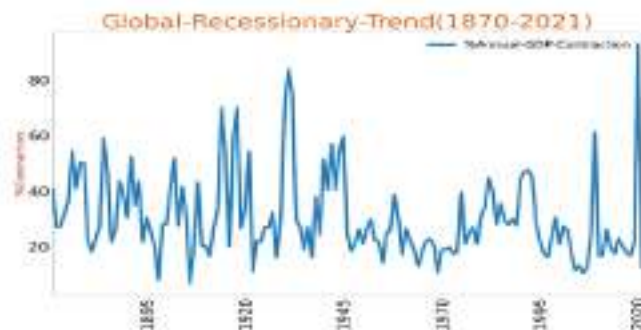

The corporate lenders of advanced countries that were more obsessed to channelize the much demanded capital through routes of FDI and portfolio investment vehicles pre COVID emergency are arguably defended in shift to secure working capital requirements with grim projections by think tanks and global intellectual fraternity about sharp contraction of global GDP at round 5% and strong possibility for its further contraction for years ahead. The spiral tentacles of world pandemic has concentrated the world resources to suppress the undesirability of its impacts at enormous policy response that on other side, has also initiated the vicious cycle of downward jump of unemployment, no income, eating up productive savings along with loss of output, productivity and skill sets both in nations demarcated by criteria of developed and developing.

An insight into global commodity market development stems the argument that weak signals of commodity market at end of 2019 that reflected into historic plunge in Brent crude oil, dampening the sentiments of commodity market are all hidden gestures of onset COVID Pandemic. The diminishing demand of oil prices and responsive cuts in oil production has a greater degree of association with discouragement of growth prospects of tangible commodities output, employment and income generation. The downgrade projection of oil demand is expected to move around 8.3% following the stagnating aviation sector.

II A. The impact of COVID19 on Global Scale:-

Aviation sector has turned out more devastating than what one would have never expected during number of military conflicts and world war regimes and other similar erstwhile medical emergency likewise at time of Spanish flu. The growth of entire Aviation sector has taken a nose dive with all fleets pushed to ground for indefinite period. The prospects of aviation sector is now almost in dole drum with cautious 30% capacity cuts, further darkening the gloomy future of those directly or indirectly associated with aviation sector. The passengers' movements for business or other recreational purposes both at domestic and international level have reached on verge of deep plunge with around 198 million figures in quantitative decline. The movement of air cargo traffic is also creeping at astonishing drop in total quantum.

Chart 2: Annual Contraction Global :Per Capita-GDP

Source: Calculated from World Bank: Report on Global Economic Prospects, June, 2020.

II B. COVID-19: A big bang to Micro and Macro Models of Economic Development:-

COVID-19 has triggered a novel wave of Big bang that seeded high scale of economic disruptions worldwide that is being seen as worst economic crisis since World War II.

The unprecedented proliferation of COVID has poised a severe future risks to workforce employed either in organized or unorganized sectors of economy due to necessitated safety measures in terms of workplace closures, imposition of lockdowns and strict restrictions on social meeting and interactions. With respect of narratives regarding to economic models operating at micro level, the global projections are more in perilous shape for countries having frequent domestic outbreaks and outward policy approaches to run domestic economic activities. They are more prone to be caught up with cascading disruptions in their real GDP growth, supply chains and medical and tourism industries. Even, the best possible prudential allocations of their resources shall yield little effect to immunize their economies from spill overs of global disturbances.

One of multipronged repercussions of COVID-19 is clearly visible from potential economic inferences in view of current and future fate of world global supply chain is that it has amplified the break of world supply chains that heavily depend on prompt and unrestricted flow of raw materials and intermediate goods. But, dynamic-input output model driven by international value chain supply and tourist movements are likely to more negatively responsive to contraction of output, trade, consumption and investment stimulations. In such regions, operating value chains agents may resort to less volatile channels to sustain their economic affairs by way of geographical diversification of supply base. Prior the eruption of COVID19, the upward trend in global supply chain was not worth of boasting high growth performer of world economy. It had only touched at about 50% capacity close to rise of global uncertainties of financial space around 2008. The subsequent years are mirrored across recent slump in global trade exchanges in response to retaliatory trade and tariffs wars between US and China.

The shocks of rapid global output contraction have become more intense post April 2020 and tended to kick off chain reaction on backward linkages sectors like manufacturing, auto, electronic and similar other areas too in a developing and least developed countries. The advanced countries are gradually under the grip of demand side shocks as result of declining propensity to consume and rise in provisions for meeting such kind of contingency in future. The diversion between input-output models may be more pronounced in mature stage of pandemic, bottoming out the demand at faster acceleration than that of supply crumbling. The countries that are serving critical link to market of consumer durable goods are worst affected by spread of pandemic, resulting the coming standstill in all manufacturing hubs located there. The imbalance in global supply chain is projected to linger on by reinforcing factors of industrial and business shut downs, tightening quarantine guidelines for movement of flow of goods and services.

II C. Circular Spillovers:

From statistical diagnosis of COVID indiscriminate spillovers, the anatomy of potential shocks generated by COVID here summed up in view of inter connected cascading impacts on micro level economic agents engaged in trade and economic activities, ranging from households income earning and spending affairs, business enterprises, firms and other direct and indirect economic entities. Within span of three months of outbreak of COVID-19 and consequent upon worldwide shutdowns, closures, curtailment of production capacity and limited mobility of essential workforce, the drop in employment is recorded at around 3%.

Domestic and International Trade Spillovers are also cost pushing factors simulated by delay in trans-border supply of economic goods, additional expenses on complying health and safety regulations all are sort of trade shocks that have overwhelmed the war time trade volatilities in all quarters of world. The ground reality of COVID shocks is seen as rapid evaporation of gains from trade, economies of scale and improvement in bargaining power in bartered capital goods of developed nations. The gravity of Spillovers caused by

global pandemic in public entertainment and hospitality sector occupies a large share out of total contagion effect on different sectors of world economy. These sectors that have been good source for generation of national economy are battling for their revival. The entertainment and hotel industries have proved easy prey to COVID-19 fury. It has been estimated during pandemic spikes, the demand for them has slipped off to about 15%.

Agriculture and Allied sectors spillovers are felt at rather less harrowing against industrial and service sectors because of number of structural rigidities of agrarian sector have come up as to blunt down the reverse channelizing the pandemic shocks. But in long run, agrarian distress may amplify from demand and supply side shocks of other sectors of economy subjected to widening economic recession.

III. ... Performance and Prospect of Indian Economy: Pre and Post COVID

The Indian economy that is deemed as power house of Asian economies and future role model of world economy is also under severe grip of merciless aggression spluttered by lethal spread of COVID-19. In fact it's not current pandemic that has first time throttled growth of Indian economy but dampening factors for Indian economy's slowdown began to inflict earlier than outburst of global pandemic. In recent decades, rapid integration of Indian economy with global economy has also been critical factor to give wings to its global exposures and risks appetite of Indian capital market. With associated high degree of volatilities.

The growth projection has shown flattening the growth pattern of Indian economy post 2000 supposedly year marked by golden growth era and subsequent years are manifested by slow recovery of growth numbers. The story of Indian economy during COVID19 era is not much different that of rest of world but impacts of COVID shocks may vary due to variations in its socio-economic fabrics.

The growth bounties accrued during high growth phase of Indian economy pre COVID period on account of breaking of macro-economic rigidities and hurdles that were outcomes of some of

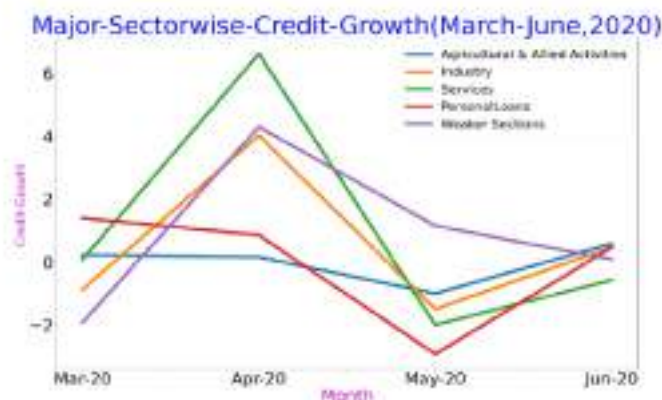

historic structural policy responses seem to have been eclipsed by spill overs of COVID impacts. The global squeezing of output, trade and restrictions on human and capital transfer have begun to unfold in respect to Indian economy and has raised question among policy makers how much Indian economy is resilient to pandemic induced global shocks and volatility? The Indian industrial sector that was experiencing the demand and supply side crunch is poised to be face more challenges, resulting the worsening incidence of unemployment in organized sector, demand contraction, supply sickness and more on desk.

With withdrawal of fiscal and monetary stimulus currently for supporting the economic activities in agrarian sector of economy have potential threat to coagulating the agrarian crisis in form of reverse influx of workforce migrated back to villages to take shelter from perils of economic closures and shutdowns. The good sentiments of agrarian sector are major decisive factors for pull effect of rural demand. Even, agriculture growth trajectory has expressed somewhat satisfactory trend maintained average 3.3% year on year basis. The initial period of lockdown has proved relatively disadvantageous to agrarian sector characterized by disruptions in demand and supply chains for farm products. But, food inflation has tried to ease out the lockdown periods agony to rural population. The less recognized but vast contributor of Indian economy, informal sector has still not recovered from two internal successive shocks of demonetization and launch of GST that another external shock has relapsed this sector under severe grip of depression. The failure of small trades and business as informal nature due to COVID stigma are expected to add misery of informal economy where low wages are big trouble creator in way of formalization of this sector.

There is no doubt that COVID induced chaos has much stockings of economic trauma and further down deep blows on social system for India. The performance of Indian economy has not been on back track of growth upswing for long even after haul of policy corrections poured down for making Indian economy globally competitive and shocks resilient. All sectorial components of growth drivers of Indian economy have registered slow and tardy performance before

explosion of COVID distress. The growth rate of economy has been lingering around 4 percent for long periods accompanied by noticeable shrinkage of industrial output, demand plunge, trade distortions, corporate sector investment shy away for taking capital market juggling and historic level of joblessness and idleness among people. All that were highlighted features of report summary of Indian economy pre COVID era.

Chart 3: Credit Deployment: Major Sectors

Source: RBI, Bulletin(2020)

As per official statistics, the sale trends of automobile segment of market space and urban consumption expenditure were too gasping for recovery during first quarter of 2020. The rural sector which emerged as salvage to deter downsizing Indian economy in new millennium as result of larger shifting of urban sector growth dividends to agrarian part of Indian economy, is too lying dormant in terms of low propensity to consume durable goods and services for long back. The ray of hope for revival of demand and investment cycle to cough up Indian growth engine seem to be suppressed by spate of COVID-19 rampage.

III A. COVID19: Macro and Micro Growth Models of Indian Economy:

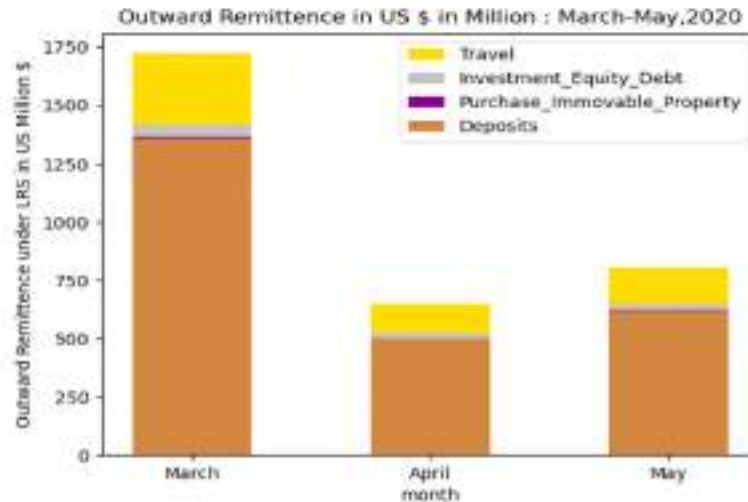

Disturbances in economic activities generated by pandemic have created wide range of disruptions in operation of macro and micro

level growth models that may have further potential challenges for relatively larger contributors of Indian growth trajectory, demand and supply imbalance, snail pace of investment and over savings and cuts on growth revival consumption. The slowdown pace of Indian economy is likely to be aggravated with time lapse by collapse of scores of factories, firms, urban business clusters, and further adding misery of reverse influx of workers on their rural home soil. The fear of long spell of unprecedented spill overs is looming large over growth of industrial, corporate, primary and tertiary sectors with no sign of flattening the COVID19 curve and its exponential spike day by day. The great degree of confusion is getting on Indian economy over its future prospect along with shattered Indian health infrastructure to cope with COVID like pandemic in coming future.

The forecast projected by world Travel and Tourism has also painted a grim picture for Indian Aviation sector that is source of living about 20 million households in country in conjunction of Indian tourism industry which too are expected to witness loss of jobs on mass scale due to halting domestic and international flights operations. The tourism sector of Indian economy serves as income earning source to around 50 million people direct and indirect ways that too has been badly hit by abrupt lockdowns and travel restrictions. The sharp decline in demand for non-essential commodities and comforts and luxuries, the firms and industries have no choice to go on mass cuts in jobs and resort salary cuts for essential staffs. The weekly monitoring report on unemployment status of country revealed shocking story of unemployment rate downward jump from first phase of lockdowns peaking to 35% from 23 percent in mid-June during unlocking period of nation.

The real estate sector that has been long waiting for catching up recovery sentiments from households and industrial segments have to wait for another uncertain period of slump in demand for their chunks to experience hot sale again. The gold and jewelry pockets of Indian business sectors which most enjoyed the U turn demand for investing in glittering metals post demonetization phase, are now subjected to sharp fall in revenue ensued by uncertain halting of social distancing and absence of feast and festivals. The bankruptcy and

insolvency for many business entities operating in these sectors are on card due to revenue faltering.

Source: RBI, Bulletin(2020)

IV The Challenges and Scope ahead: Post COVID

In this section, the challenges and scope for revival of world economy as well Indian economy with more depth analysis are discussed from length and breadth.

- The reshaping and speedy nursing the wounds caused to global economy and Indian economy will greatly be determined by degree of simpler and faster reforms packages to be invested for restricting the economy in line with unhindered adjustment between capital and workforce.
- The battered Infrastructure of health care system has proved eye opener for many emerging economies how they are poorly prepare to deal with eventuality caused by such kind of medical emergency in future. Since, human capital is indispensable for prosperity of any nation, COVID era lesson may be used as strong stimuli

to allocate reasonable funds for strong medical and health care facilities like countries as India.

- The retention of human and physical capital for accelerating the recovery cycle with mantra of sustainable growth has emerged as one of the striking challenges before global community. That indeed is precursor for reshaping the world economy and rethinking the validity of various world economic models that have resulted more in promoting the asymmetrical development of world.
- Considering the quantitative harms and damages caused by Pandemic in all layers of economy, the disparity of income and wealth in third world countries tend to perpetuate further against developed cradles. Thus, more curative and aggressive qualitative attacks on such economic threat are genuinely required by political and public machinery there in.
- Bad phase of COVID pandemic has somewhat highlighted the critical importance of digital space in our day to day life. In case of India, digital economy is still under phase of fledgling stage and has to go far way to realize the dream of cashless economy and digital super power. In wake of warding off anyfuture pandemic, digital expansion to rural sector may be on top priority agenda for recovery measures. For India, the issue of recession has deepened more by institutional level bottlenecks than financial sector generated recessionary trends so this issue is expected to find high score in wish list of reforms during and post COVID periods.

A SYSTEMIC RESILEANCE APPROCH TO DEALING WITH COVID-19

Dr. Gurupada Bera

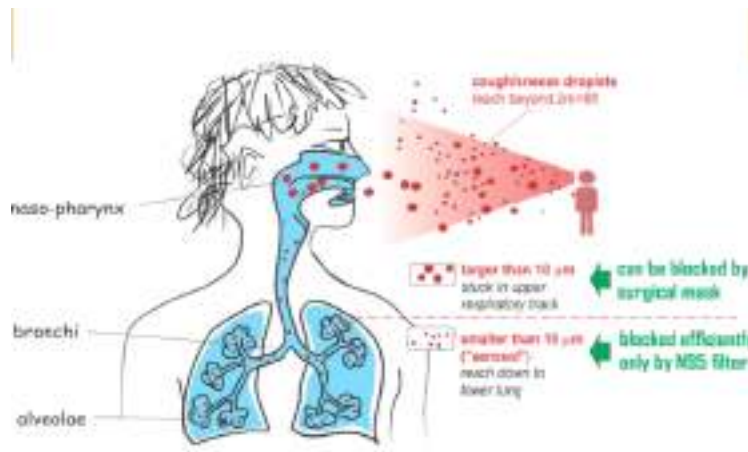

Introduction

We are now in the middle of a Global Pandemic, COVID-19. Our life process has become a stand still. Thus, it is a most burning issue of the time. My role as a health worker, will be to take the fear out so that we can start again in our activities towards achieving our goals.

For this reason, it is now very important to know what COVID-19 is, why we are afraid, how it affects us, what are the suffering. How we can manage and when we can win over the situation.

It is an infection by one virus (SARS COVID-19, an RNA virus) like other viruses e.g., Dengue, Chikungunya, Nipa, H1N1 etc. It is completely a new type of virus, so we are not aware of its mode of affection, how its spread, what are the organs affected, where and how long it multiplies. So initially we had to shut down ourselves inside home. Then as we have come to know its nature and whereabouts, we want to start our activities taking all the precaution to prevent and full proof measures to manage it.

It enters our body through Mouth, Nose, and Eyes. It spreads usually by droplets and also by surface to surface contact. It may also be air-born as claimed in case of community spread.

It cannot multiply outside the human body.

It dies out inside the body after nine days.

It dies out outside the body after 3-10 days (dependig on type of surface)

Thus, we can divide the whole process of the suffering clinically into two stages.

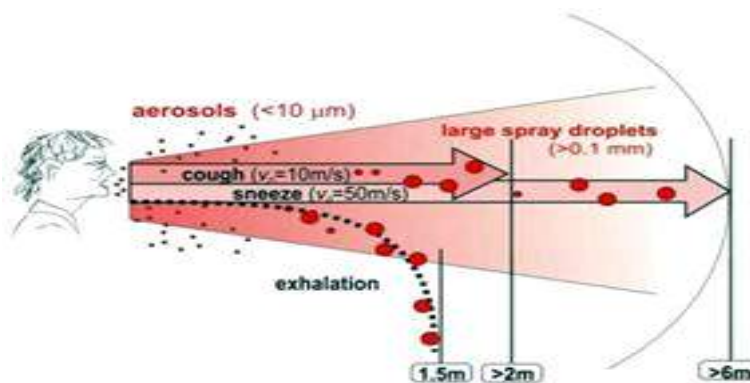

- 1) COVID Stage 9 days
- 2) NON COVID / POST COVID Stage...10 days to 3/4 months.

It affects almost all organ of the body except. Vocal Cord and Joints

Types of the disease

1. Non-Pulmonary – Most Common
 2. Pulmonary
 - a) Pneumonic
 - b) Non-Pneumonic (upper respiratory or, bronco pulmonary)
- Non-Pulmonary (Approximate % of affection)

(One study-report by Dr, K K Agarwal, Delhi. Past
President-IM A.)

Sorethroat: 90%

Fever: 60%

Dry cough: 60%

Diarrhoea: 10%

Pain Ear: 6%

Typhoid type fever: 4%

Loss of smell and / taste: 3%

Headache: 3%

Conjunctivitis: 1%

Pain Right Lower Abdomen: 1%

Burning Micturition / Pain testis 1%

Muscle Pain below knee: 1%

Pulse rate rapid increase on walking (Breathlessness)9%

Skin Rash or discolouration of fingers or toes: 2%

Recovery is the rule.

Infective stage of / from a person is only 9 days

It needs some precaution / prevention, timely management
and removable of fear psychosis.

Follow the guide line laid by the WHO

It is more a concern (high mortality) with elderly person and persons with co-morbid condition like heart disease, high blood sugar, high blood pressure, respiratory problem, kidney disease. The young have to save themselves. They may be the carrier also. But one thing is common amongst all is the low immunity. So, after all attempts to prevent the entry of the virus the most important precautionary measure is and must be to improve the immunity.

Defense is the best offence here in this condition when particularly, it may be air born or from the community spread. So, improving immunity should be given the most importance and that too now. We should use our immune system to fight down the killing power/virulence of the virus.

Immunity is what will ultimately determine as to who will be affected and who will not. Also, who will fight it out and who will not be able to and succumb to it. We have to take the charge of this now. We have to change our lifestyle now because it is not an overnight phenomenon. It takes time with consistency and persistency with sincerity to really build the immunity.

To build Immunity is not tough either. Avoid refined sugar, refined oil, refined food grains like Maida, Suji, junk food, etc. Body needs

healthier grains, fresh vegetables, fresh fruits, healthier grains, phytochemicals, millets, proteins, vitamins, sufficient hydration, sunlight, love and care. It is not difficult. Social/physical distancing, regular exercise with yoga, pranayama, good sun light, good sleep, good personal hygiene, some remedies and supplements will boost your energy as well as immunity. Your body will love you and ultimately thank you.

You need to abide by some Don'ts to save the immunity. Avoid smoking, avoid junk food, avoid alcohol, avoid stress, and avoid staying lonely.

Dr. Sanjay K. Rai
PRESIDENT

Dr. Sanghamitra Ghosh
SECRETARY GENERAL

Public Advisory for control of Corona Virus Disease (COVID-19)

Globally, we have more than 150,000 cases and 5,500 deaths from Corona Virus Disease of 2019 (COVID-19) across 147 countries (15 March 2020) and the numbers are rapidly increasing. In addition to what the government is doing, we as public can do a lot and should take responsibility for protecting ourselves, our families and those around us.

The only source of infection is infected human cases. Hence best way to limit the spread of disease is containing the infection at source. There is no vaccine available yet. Those without disease also need to take preventive measures to protect themselves. On behalf of its 8500 plus members, IPHA, the oldest and largest public health professional association of India, we issue following appeal:

1. Source Containment:
 The most effective strategy for control of Corona Virus (COVID-19) is that all symptomatic individuals (both individuals reporting flu like illness) and those with history of recent exposure to a suspect case should take following two actions:

- i. **Ensure at least 2 weeks of self (mild cases and contacts at home) or hospital (severe cases) isolation.** On developing a flu-like symptoms, don't panic. Stay at home for mild illness, and do not rush to the hospital; call the helpline number for healthcare (state wise list on the back side of this brochure).
- ii. **Practice cough etiquette.** Cover the mouth and nose with tissue paper while coughing or sneezing and immediately dispose it in closed container followed by proper hand washing.

Once in contact with healthcare provider please follow their instructions.

The above two steps would ensure that your family members and those around you do not get infected. As a responsible member of your family and citizen of the country, with the above strategy you will help in breaking the chain of transmission and thereby control of spreading of corona virus disease in India.

2. Protection of General Public (those who are not infected): General public should practice three things
 - 2.1 Handwashing,
 - 2.2 Cough etiquette (described under II above) and
 - 2.3 Social distancing (avoid body contact such as hand shake or hugging, avoiding mass gatherings, and maintaining distance (approximately 6 feet or 2 meters) from others when possible).

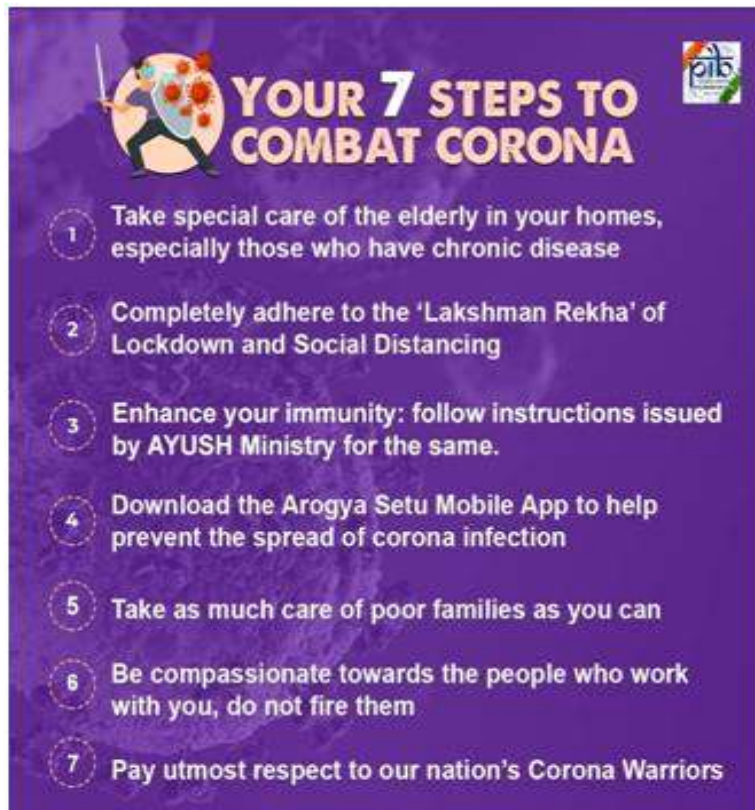

The first two practices should be adopted as life-long habits as these protect against seasonal flu, avian flu, cough and cold, and future outbreaks of new respiratory infections and other respiratory infections like Tuberculosis, pneumonia, etc.

These measures will complement the excellent efforts being currently undertaken by the government including quarantine, hospital isolation, strengthening of diagnostic and treatment services of public and private hospitals to stop the current pandemic of Corona virus and provide appropriate treatment to those who need it.

Look out for advisories from local, state and central government on Corona Virus and follow their advice. Refrain from sharing unverified messages and information on social media.

Exposed area of face and neck may harbour virus. Touching that area by fingers will carry the same virus. Subsequent touching of any site of eye, nose, mouth or any part of the body will transport the same virus to facilitate infection.

YOUR 7 STEPS TO COMBAT CORONA

- 1 Take special care of the elderly in your homes, especially those who have chronic disease
- 2 Completely adhere to the 'Lakshman Rekha' of Lockdown and Social Distancing
- 3 Enhance your immunity: follow instructions issued by AYUSH Ministry for the same.
- 4 Download the Arogya Setu Mobile App to help prevent the spread of corona infection
- 5 Take as much care of poor families as you can
- 6 Be compassionate towards the people who work with you, do not fire them
- 7 Pay utmost respect to our nation's Corona Warriors

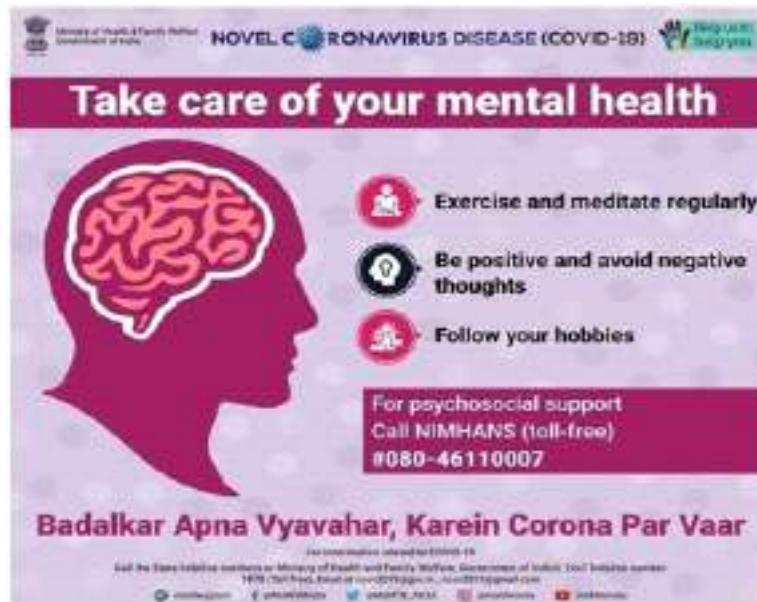

Evidence shows that stigma due to #coronavirus leads to:

- Reduction in people seeking medical care or testing
- Reduction in people adhering to interventions (including self-isolation)

This can lead to **cases not being reported**, and more **people being exposed** which makes responding to the outbreak **more difficult**.

#SolidarityNotStigma

Mental health problems are very common because of restriction in academic, social and economic activities which may lead to commit suicide even. There are several documents by this time. So special care is to be taken as advocated by the Ministry of Health and Family Welfare, Govt. of India.

Talking to people whom you trust can also help in this condition. Always share with them your feelings and activities. Prepare mentally to help others if so needed.

Never hesitate to seek professional help if you or your family need it. First person to inform is your local health advisor. You should use the local helplines as published time to time in different medias.

We can follow these new normal as and when demanded.

Human clinical trials for the COVID-19 vaccine has been started in India with 1000 volunteers as stated by ICMR (as on 25.08.2020). India is the largest producer of vaccine. This vaccine will break the chain of transmission of the virus and thus will control the spread of the pandemic..

Humanity should never allow a repeat of same mistake in 1918....

LESSONS OF HISTORY

The most severe pandemic in history was the Spanish Flu of 1918. It lasted for 2 years, in 3 waves, with 500 million people infected and 50 million deaths. Most of the fatalities happened in the 2nd wave. The people felt so bad about the quarantine and social distancing measures that when they were first lifted, the people rejoiced in the streets with abandon. In the coming weeks, the 2nd wave occurred, with tens of millions dead.

Let's not repeat history in the time of Covid-19

**Relaxation is only given by Government.
Corona hasn't given relaxation**

A mask is better than a ventilator,

Home is better than ICU,

Prevention is better than cure

So, take it as an adverse situation only

And

Not an absolute obstruction.

Build your immunity now and practice good health and hygiene.

We will win over this pandemic and also any other ahead.

Remember——If affected——”SO WHAT”

Should we start our activities—— “WHY NOT?”

ROLE OF PSYCHOLOGICAL COUNSELLING DURING LOCKDOWN PERIOD FOR CHILDREN WITH SPECIAL NEEDS: A QUALITATIVE STUDY

Miss. Aditi Biswas

ABSTRACT

Counselling provides information about resources and treatments available, as well as coping strategies that may be beneficial to families with a child suffering from a disability. The purpose of the present study is to determine the role of psychological counselling during lockdown period for children with special needs. Total 15 parents were counselled telephonically regarding their upcoming problems of their children which arise during this lockdown period. Parents called up the psychologist through the helpline number. The main problems parents talked about were the behavioural problems of their children during this lockdown period and also the activities that can be given to them during this period. The psychological tele-counselling helped the parents and also their children to overcome with the current situation, also the psychologist followed up with the parents regarding the intervention or management plan provided to them and how their children are responding to it. Documentation of the client's problem was maintained which helped in the follow-up procedure. A questionnaire was prepared from which the problem of the child could be addresses. The feedback received from the parents were quite satisfactory,

parents were benefited from the telephonic psychological counselling provided to them. As the COVID-19 continues this online psychological counselling gave an added benefit to the parents and the children with special needs where they can put up their problems and get guidance to deal with the problem. Apart from tele-counselling parallel online classes of special education, occupational therapy and vocational training were also provided. In this tele-counselling all the preparatory measures were taken. The objective of the study counselling on parents will be that they able to recognize the needs of their child and provide better care, emotionally and physically function better, strong relationship and better family for children. Through counselling parents will be able to manage these situations during this lockdown period.

Keywords: *parents, disability, psychological counselling, management plan, tele-counselling.*

1. INTRODUCTION:

Lockdown, COVID-19 has changed our lives drastically. We all are going through a tough situation and as the time passes by we are heading to the new normal. But the scenario is different for children with special needs. They are facing a huge set back in their areas of development. As the school, playgrounds, therapy centers are all closed children are confined at their home. Every child is unique in his/her own way, they have different abilities, strengths, but we were not prepared for situation this nor do they. Children were not prepared for such type of vacation which has made them frustrated.

In this critical times as we all have to maintain physical distancing, confined at our homes, therefore the medium to connect with the outer world is the online mode. With the help of this online medium we are able to connect with the children with special needs and provide them with the online services that are available.

The challenges that come with raising a child with disabilities can lead to increased stress and decreased quality of life in caregivers who are not properly equipped to handle such challenges. According to a study conducted by Minnes et al. (2014), the methods parents used to cope with distress and child characteristics most strongly

predicted whether or not positive gains for the children and lower parental stress occurred.

Counselling and education provides information about resources available, ways to improve coping strategies, and treatment options. This creates better outcomes for the family as a whole: parents, other siblings, and the child.

Additionally, this psychological counselling added an extra benefit to parent empowerment with greater positive gain and decreased parental distress. Parent empowerment can be related to feelings of self-efficacy, where parents feel that they have the strength and ability necessary to achieve goals and overcome obstacles.

A study by Haugstvedt et al. (2012) aimed to explore how parents handle situations after attending a group-based counselling program. This program helped parents in self-understanding. The discussion contributed to parents finding new possibilities and priorities in handling situations. They were able to learn better ways to use their resources and find satisfaction by gaining a sense of self understanding and seeing what held importance in their lives.

It is well established that children with disabilities are at increased risk of experiencing behavioural problems (Baker et al., 2003; Emerson, 2003; Roberts, Reid, Taylor, & Mazzucchelli, 2003; Sofronoff, Jahnel, & Sanders, 2011) while parents and caregivers of children with disabilities experience more stress, worry and depression (Einfeld, Tonge, & Clarke, 2013; Herring et al., 2006; Hudson & Gavidia-Payne, 2002; Stuttard et al., 2014).

Many children with disabilities have challenging behavioural disturbances or complex physical needs which can place an enormous stress on families. Parents are likely to be confronted with limited support resources in the community and long waiting lists. As well, many families of children with disabilities are economically strained as mothers may not be able to return to work and there may be extra expenses in supporting the child (Cantwell-Barti, 2012). Family needs a lot of support from the community in order to care adequate for the child special needs.

During this pandemic it has been observed through various means that children with special needs faced huge problem, as their scheduled routine which they are following after immense practice have been disturbed. The effect was observed through their behaviour which they executed being confined at home during the school hours or any other engagement in any rehabilitation center. On the other hand, the parents specially mothers face challenges for managing their children and also household activities. They faced difficulty in managing the unwanted behaviour which emerged due to this lockdown and also the activities to be assigned to their child by which they will be engaged.

The gains received from counselling whether social support, coping mechanisms, or opportunities available- could create a better quality of life for parents and their families. Additionally, more positive coping responses and reduced stress could lead to more positive interactions and better outcomes for the child.

The purpose of this study is to determine if psychological tele-counselling program for parents may improve problems the children with special needs are facing during this lockdown period. It also focused whether online sessions helped parents to improve their quality of life and also deal with the needs of their children effectively.

2. IMPORTANCE OF COUNSELLING

Counselling is viewed as a personalized, intimate interview or dialogue between a person experiencing some emotional, social, educational, physical, and vocational problem. It can also be seen as a service that helps individual to solve problems and learn to cope with these problems that are not easy to solve. This is why the special needs population can be focused so that they are assisted out of their needs. Counselling is designed to remove the emotional, psychological and personal social roadblocks placed in the way of an individual by the multidimensional problems of the day to day life. The involvement of counselling with special population therefore is to improve and possibly remedy the challenges, facing people with special needs.

Counselling has been used to designate a wide range of procedures comprising advice giving, support in times of trouble or need, encouragement, information giving, and test interpretation. Counselling is a process by which a person is assisted to behave in a more rewarding manner.

Research indicates that parents of disabled children are particularly vulnerable to stress, for example, high levels of distress have been found in up to 70% of mothers and 40% of fathers of severely disabled children (Sloper and Turner, 1993). In addition, both the general psychological literature and specific studies of disabled children show that parental distress and family functioning impact on children in numerous ways, affecting their cognitive, behavioural and social development (Wallander and Varni, 1998).

The role of counselling in this pandemic situation is vital, because it has a great impact on the mental health of the client. Parents of children with special needs also face a huge problem from the beginning but now the scenario is more difficult as they have to look after their child 24x7. The online counselling sessions helped parents specially mothers to reschedule their child's routine, activities to engage with, resolving of problem behaviour issues, also making them more independent in ADL skills. Psychological counselling acted as a support system where parents can speak up their pent up feelings and get the issues resolved to some extent and help the child with special needs adapt with the current environment.

3. OBJECTIVE

To determine that psychological counselling for children with special needs will be beneficial during this lockdown period.

4. METHODS

4.1 DESIGN

The present study involves psychological counselling program through telephonic conversation for children with special needs. The helpline number was given in website and social media from which parents called the psychologist. Most of the calls came from mothers and the issues they came up with were of behavioural issues of their child and the engagement of their child during this lockdown period.

The parents call in the helpline number and it was transferred to the psychologist. A questionnaire was also included in this study from which detail information was gathered about the particular issue whether it was before lockdown and after lockdown. Follow-ups were also documented which showed the improvement in the behaviour of the children. Also the counselling targeted the activity to be entitled for the child for his/her engagement. Parents also came up with sensory issues and academic problems where the special educator and the occupational therapist gave the management or intervention plan for their child, which was also documented too. This tele-counselling program helped the parents a lot specially mothers as they have to balance both home and their child. The online session that was provided for their children regarding the activities for engagement added extra benefit to the program. For those who were unable to access the online classes were given the assigned task for their children over phone and a follow up was recommended form parents which helped to know about the child progress in the lockdown period. For this present study the 15 participants selected were those who continued the follow up session.

4.2 PARTICIPANTS

For this study the target population selected was parents specially mothers of children with intellectual disability and associated condition. The total sample size was 15. The age range of children was between 5yrs to 12yrs of age. The samples selected for the study were mothers who were enrolled with some rehabilitation centers. The ages of the mothers were between 30 to 45 years which was documented and also from where they are calling. Consent was taken from mothers that their psychological counselling which was documentation was used for the present study.

4.3 TOOLS USED

The primary tool used for this study was the interview method. As the psychological counselling was over telephone therefore it was named as tele-counselling interview. With this a questionnaire was prepared and used depending upon the additional information about their respective problems of their children. The questionnaire used was open questionnaire because there is lot of scope to answer about

the questions asked to. The psychologist asked the questions to the mother and the verbatim was recorded which was later used for interpretation.

4.4 PROCEDURE

In this study parents called in the helpline number and were connected to the psychologist. The rapport too here was established to give that support and acceptance which was given in the physical presence when clients visited any institutions. At first the demographic details of both the informant and including child's disability criteria was recorded. The psychologist listened to the verbatim of the mother and noted it with that a questionnaire was used which was asked over telephone and documented. After gathering the information the psychologist provided the management for the child which was then followed up in the upcoming sessions. During the tele-counselling it was asked whether the problem arise specifically in the lockdown period or it existed before but it was exaggerated during this lockdown period. Also the activities of the child were taken into concern. The engagement of children at home with meaningful activities was also recommended to mothers. Follow up was recommended by calling in the same help line number. The whole procedure of counselling went on until the issues were resolved.

4.5 DISCUSSION

In the present study how psychological counselling helped parents of children with special needs during this lockdown period was the main objective. The mode of counselling was done over telephone through the helpline number available. At first the psychologist counseled the mother to be stress free and made her relaxed because she will be the one who have to deal with the child the most. As we all know special children follows specific schedules or routine, so the first target was to reschedule the routine of the child and get him adapt with new schedule because the current situation is different from vacation. The informants were requested to make their child adjust with the current scenario. The schedule includes a daily activity schedule which comprises of activity, time involvement and activity performed by whom that is the child

independently or taking the help of others. As per the behavioural issues that were reported some of them included hyperactivity. Behaviours like irritability, spitting, throwing temper-tantrums and stubbornness were also reported. Few of them include skill deficit behaviour as the child was unable to understand why they are confined at home all the time and not going out due to which they executed certain unwanted behaviour which was previously not present before lockdown. For resolving the behavioural issues mothers were instructed to find out when, where and with whom the child is showing the unwanted behaviour and it was reported to the psychologist in the follow up sessions. The psychologist documented the problem behaviour and gave the intervention to the mother. For example one of the mother said about the spitting behaviour in front of others and when excited. The psychologist recommended the mother for physical restraint and also asked her to model the behaviour of not spitting in front of others also when excited the child was asked to perform an alternative behaviour like clapping. This alternative behaviour was then reinforced by the mother and gradually there was a decrease in the spitting behaviour. The psychologist explained about how to maintain this alternative behaviour so that this behaviour comes into practice. In training children with special needs reinforcement is a major tool.

Another important issue that emerged during the sessions was how to engage the child as now children are confined at home, unable to go school, clinics or any other rehabilitation center. In context to this during the counselling session the role of special education also came into forefront. Here the psychologist and the special educator consulted and designed an individualized program for the respective child as per his/her needs. Online special education classes were prepared to give the child support in the respective area he/she facing challenges also making the child learn new aspects.

There were mothers whose children were diagnosed with autism, for them it was more difficult to manage their child because autistic children stick to sameness and during this lockdown period their schedule has been affected a lot. For children with autism it was recommended to reschedule their routine and get them adapt with it,

visuals were also recommended for daily activity which included their personal, social, academic, occupational and recreational activity. It was recorded from mothers that the new schedule help the children to calm down, lessen their anxiety and cope up with the new situation.

There are few other issues that came into notice, those were practicing hand washing, wearing face mask , also wanting to go out of the house and also how to explain about this COVID-19 virus due to which there was a lockdown and is still continuing in many places. For this upcoming issue parents were guided to teach their children by selecting each of the tasks in step by step procedure. One of the mothers' asked how to make the child adapt with wearing face mask as her child did not put it for a long time. Here it was suggested to model the behaviour of wearing the face mask to the child at home and make him/her wear the mask for few minutes and remove it, after which reinforce the behaviour. Gradually increase the time of wearing face mask and reinforce the child always. This training helped the mothers a lot and now many of the children have adapted to wear face mask. In case of hand washing same method was used with prompts as and when required. Mothers often asked as it is now unlocking they can take out their children out of house for play or a walk. Here it was recommended to take the child out with all the precautionary measures and also teach the child how to take precautionary measures so that he/she can learn from the current situation. The main purpose of this psychological counselling is to make children with special needs more independent as this is the time that they can learn innumerable things with the involvement of their parents and therapist who is there to guide them.

As the situation is new to all of us at first it was difficult to conduct psychological counselling, this is because online counselling for children with special needs is quite difficult because in this the psychologist have to counsel the parents regarding their child's problem and then the guide them about the intervention. As the time passed by mothers parents took initiative to call the psychologist and take the guidance. The school has not reopened yet and also many rehabilitation centers are also closed therefore this online counselling

continues, but there has been also a criteria of termination of the clients when issues are resolved. Those clients can also call again if faced with any other challenges with their children.

Apart from this counselling session, online special education sessions were arranged for children with special needs. Here the special educator prepared the activity for the child depending upon his potentialities and level. There were also sensory issues reported specially for autistic child who was consulted with occupational therapist and intervention was planned out.

Therefore, in this online psychological counselling session other support services were also adopted to help the children with special needs in demand. The online psychological counselling is still continuing as lockdown has increased in many parts.

5. CONCLUSION

The present study revealed that psychological counselling has a stronger connection and positive relationship to enhance the quality of life and to adjust with the sudden outbreak of pandemic for these mothers. Psychological counselling is an important platform to provide better awareness, understanding and useful way to manage the critical situations.

6. RECOMMENDATION

Parents need to feel supported and to have opportunities to convey their problems to the therapist during the online session

The therapist should be empathetic

Providing resources to parents online.

Preparation of videos and work schedules for children and sharing them online.

In rural areas where access of internet is poor for them over telephone counselling should be recommended.

Arranging free webinars for parents on different topics which will be helpful for them and for their children regarding the challenges they face

Though online professionalism should be maintained.

Effect of Lockdown on Human Mental Health and Hygiene

Dr. Nanda Kishore Mondal

ABSTRACT

COVID-19 is now a global issue all over the world. As per data as on 11th July' 2020, 1, 26, 25,155 peoples have been already affected by this contagious corona virus all over the world. To desist spread of this infectious virus, government takes various steps and lockdown is one of the major step. In this period, peoples kept at home for a long time and detached from his surrounding as well as his work place. Many people dismissed from his work. Peoples spend their life through a critical situation. Always a fear and anxiety raises among people. As a result, despondency arises among them and they become depressed gradually which causes of mental disorder. Children are also affected and become incursive. On the other hand, mental health is avowed as an important aspect of total health. Mental health may comprise an individual's ability to enjoy life and to create a balance between life activities and efforts to achieve psychological resilience. So we shall have to stay positive in this troublesome situation and have to overcome it. For that, we have to engage with different types of creative and productive work, regular physical exercise, linked with social& electronics media and different types of entertainment programme.

Keyword: Virus, Affected, Situation, Mental Health,Activity.

1. Introduction:

In present era, mental illness is an emergent problem and day-by-day it increases gradually. In this era peoples are busy with packed up work schedule and no time for taking minimum rest. Many times, excess demand of peoples make depressed which cause of mental illness as well as physical illness.

In present pandemic COVID-19 situation, maximum people are depressed or frustrated in various aspect which causes mental illness. But to stay safe, at first we have to overcome these mental illness and established ourselves as mentally healthy person.

2. Objective of the Study:

The objective of the present study is- “To find out the causes of mental illness & measures to stay mentally stable in lockdown period.”

3. Methodology:

This present study is based on secondary sources like Books, Articles, Journals, Medical Bulletin and Expert opinion, TV News Channel, Opinion of Psychiatric Counsellor and Websites etc. The method used is Descriptive Analytic method.

4. COVID-19 and Lockdown:

Corona Virus Disease 2019 (COVID-19) is defined as an infectious virus belongs to the larger family of Ribonucleic Acid (RNA), leading to transit, from common cold to more dangerous diseases like Middle East Respiratory Syndrome (MERS-CoV) and Severe Acute Respiratory Syndrome (SARS-CoV). This virus was first brought to light in December 2019 in Wuhan City, Hubei Province, China. The first case of COVID-19 in India was reported on 30th January' 2020 in Kerala. According to the statistical report on 11th July' 2020, total no of affected people all over the world is 1,26,25,155 out of which 5,62,769 peoples are already died, 73,60,954 peoples recovered from this disease and total number of active cases 47,01,432 (www.worldometer.info&Medical Bulletin of World Health Organization July,2020).

On 22nd March' 2020, 14 hours voluntary public curfew pronounced by the Honorable Prime Minister Narendra Modi which

succeeded by mandatory lockdown in COVID-19 hotspots and all major cities. Further on 24th March'2020, the Prime Minister of India ordered a nationwide lockdown for 21 days, explaining that it was an indispensable and feasible measure for disruption the COVID-19 infection cycle. Social distancing is a critical means to break the cycle of infectious virus which may remarkably decreases the spread rate of infection phases (Asian Journal of Psychiatry, June 2020). Further it was extended up to 31st May' 2020 through phase by phase with substantial relaxations. On 1st June' 2020, government has started unlocking the country in three unlock.

5. Mental Health:

Mental health and hygiene is acknowledged as asignificant prospect of one's total health status. Sluggish hygiene often descant certain mental or emotional distemper including depression and psychotic disorder. Mental health may defined as:

- Mental health is the parity of psychological prosperity or a penury of mental illness.
- Mental health may comprise an individual's caliber to enjoy life and to create a balance between life activities and efforts to achieve psychological resilience (U.K. Surgeon Journal, 1999).

6. Relation between Physical and Mental health:

Physical health is inseparably linked with mental health. If a person is suffering from acute physical illness for a long time, automatically a mental panic arises which may causes of psychiatric disorder. From common physical illness like fever and headache, normal mental stability hampered and mental irritation increases. On the other hand, in many cases mental illness affected normal physical health condition. In one side, as excessive mental depression, frustration, anxiety can make a people psychiatric patient, on another side it equally affected the normal physical health---affected the nerve system, increases the joint pain, decreases the bone density, arises muscle pain, may suffer from breathing problem, headache, drowsiness etc. Excessive mental pressure also may causes of sleeplessness, affected the body organ and also affected the body immunity power (<https://www.mohfw.gov.in/> Das, 2020).

7. Factors affecting mental health:

The specific condition(s) which is only responsible for mental health i.e. may causes of mental strength or illness, is known as the factor of mental health. Following are the factors which affected our mental health condition (<https://www.canwetalk.ca>about-mental-illness>):

• 7.1 Self-Esteem:

Self-esteem makes a man mentally stable and healthy. People always judge themselves and also admire themselves. They should not affected by the word of critic, which may causes mental disturbance.

• 7.2 Feeling loved:

We know that love is like an energy booster for human being. Feeling love towards anyone or anything or own self, makes everything beautiful and life becomes cheerful and mental health becomes strong. But, if peoples cannot love own self, then everything becomes irritating to them which is nothing but the result of mental instability.

• 7.3 Confidence:

By self-confidence, peoples make them mentally stable. If a person having self-confidence, he can reach to his goal by taking proper decision. In case of failure in any field, he cannot losses his confidence and ultimately become success. Lack of confidence means lack of mental stability.

• 7.4 Family break-up or loss:

In many cases, family break-up or loss in any aspect create a painful experience in human's life which may causes of mental disturbance or mental illness.

• 7.5 Difficult behavior :

People concerning difficult behavior cannot share their emotion, feeling like sorrow, enjoyment, frustration with other and they become depleted by the mental illness.

- **7.6 Physical illness:**

From the previous discussion, we came to know that physical illness is closely linked with mental illness. So undoubtedly it may state that physical illness is a very important factor for human mental health.

8. Types of Mental illness:

In practice, it is found that there are different types of mental illness arises due to different reason which affect our mental stability. Different types or forms of mental illness (www.healthdirect.gov.au) are as:

- Temperament disorder.
- Anxiety disorder.
- Personality disorder.
- Psychotic disorder.
- Eating disorder.

9. Sign of Mental illness:

It is very common fact that in case of any types of disorder, either physical or mental whatever may be, it must expressed by his body language, attitude, gesture or through behavior. Some of this unusual behaviors is considered as a sign of mental illness (Albert,ed). Few remarkable sign of mental illness are as:

- Mental irritability is a very common sign of mental illness.
- Over much high or low mood is also a sign of mental illness.
- Another most significant sign of mental illness is excessive fear, anxiety and cogitation.
- Sometimes it has been noted that peoples withdraw own self from the social surroundings. It is also a sign of mental illness.
- People may affected by mental illness when there occur a dramatic change in their eating or sleeping habit.
- Lack of concentration is also a sign of mental illness.

10.Causes of Mental illness:

As cold-cough and fever is very common fact in case of physical illness, on the other hand anger is very common in case of mental illness. If we want to find out the causes of mental illness, at first we have to find out the causes of anger. In short and brief “Powerlessness” is the only cause of anger.

Now, why we feel powerless? Which factors plays the emergent role behind of it? Some factors are responsible for this powerlessness which are well known in abbreviated form “CCC NERO” which stands for C-Choice, C-Control, C-Connectivity, N-Need, E-Emotion, R-Right, and O-Opinion

We know man is a social being and lives in the society with self-respect. Everyone have own choice and demand for that. If one forced to do something apart from his choice, create mental stress which may be the cause of “Powerlessness”.

Anything out of control of peoples make them powerless which also be a cause of anger with a question-”Why is not it under my control?”

Normally, as a social being people must connected with his relatives, neighbors and other peoples which makes life wonderful. But for any inconvenience, if this connection or communication is suddenly breakdown, it makes a man lonely which also a cause of powerlessness.

On the other hand, every people has a basic need in his life. It may be financial need or any other social need. One who cannot fulfill his basic need in any cost, it makes him powerless. It makes anxiety, depression in human mind which is a form of mental illness (<https://www.mohfw.gov.in/>).

If a people banged from the nearest one or from an unexpected incident in life, people feels powerless emotionally. So emotion is also a cause of mental illness.

As per our constitution, everyone have a basic right in his life. But when one deprived from his basic right, it makes him powerless and he depressed gradually. This is nothing but one type of mental illness.

Again, when people cannot place his opinion, it may create either irritability in mind or it depressed him. So opinion is also a factor of mental illness.

It has been noted that anger are basically two types-Instrumental Anger and Reactive Anger. Instrumental anger never be the cause of mental illness, only the reactive anger is responsible for the mental illness. Gururamion, 2006).

11. Effect of Lockdown on Mental health:

To withstand or reduce spread rate of infectious corona virus, lockdown was declared by the Prime Minister of India on 24th March' 2020 and it continued up to 31st May' 2020 through phases. But it has been found that many peoples lost their job in this period, there was no physical communication among the people even if with the relatives also. Schools, Colleges was totally closed and hence students of all ages are also bounded with in the home to stay safe. It create a mental distance among the peoples. In this lockdown period, most of the factors of mental health is violated. Out of them Choice, Connectivity and Need –these three factors are violated significantly who makes peoples mentally ill. In this pandemic COVID-19 period, always an anxiety, uncertainty works in human mind which makes people powerless.

12. How can we overcome Mental illness?

To overcome the mental illness, we have to moderate our life-style and thought in every aspect of life. We must follow some strategies or way to reduce or forsake the mental stress as:

- Pranayama is the most powerful equipment to reduce mental stress. So we have to do Pranayama regularly for 15-30 minutes.
- Meditation is also a fruitful expedient to get relief from mental stress, anxiety etc. So we must utilize this in our practical life.
- To thrive ourselves physically and mentally, we have to do physical exercise regularly.
- Yoga can relief us from mental irritation, depression, anxiety

etc., so we have to do yoga maintaining a proper schedule.

- The basic incantation to thrive ourselves are-Be active, Be aware and learning new thing. These three also can ward off mental anxiety, depression and makes a person mentally healthy (<https://www.mygov.in/COVID-19/>)
- We must to join us with different works like creative hand-craft, paper writing and any other creative and productive works which can be possible within the home. It makes us engaged with work and side-by-side we can guard against the financial crisis.
- Instead of mental panic, we must be aware about the total circumstances and take the proper decision which can help us to overcome the critical situation.
- We have to engage ourselves with a new one which can closely interact our mind and relief us from the repeated painful thought.
- In this pandemic COVID-19 situation, in spite of physical communication, we communicate with relatives, friends and other known person through the telecommunication system and social media like phone call, Facebook, Whatsapp etc. which can reduce our mental stress as well as mental illness (Seven tips to manage your mental health and wellbeing during COVID-19 outbreak by Desiree Dickerson. Nature 2020).

13. Conclusion:

In our life, may evil day arises but we will not depressed, we will not flight, we will fight against the evil one and we shall overcome some day. To do this we have to mentally stable and healthy. So we all be aware about our mental health and always try to be mentally strong.

Creativity: A Milestone for Mental Wellbeing

Sulagna Chakraborty

ABSTRACT

The outburst COVID-19 pandemic brings great challenges to the worldwide people's daily lives. Boredom creates moments where mind explore desperately .We get ravenous for incentive, and so we begin to search the recesses of your mind, reaching out and hoping something grabs by the hand. This searchinginspires creativity, creative thoughts, accomplishments, and innovation implementation. People will find new ways to cultivate creativity and express themselves. The immerse nature of being creative help us to focus mind and control our thoughts. Physical exercise benefits our body, being creative is a way of stimulating our mind. Positive mind-set can go through a difficult time of our entire life in any kind of problematic situation. In this ongoing Corona crisis, people are bounded to think more acutely engaging their minds in creative works by constructive ways.

Keyword: Creativity, Mind, Thoughts.

1. Introduction:

Due to COVID-19 pandemic everyone is going through a tough phase and challenging to deal with the abrupt change in Lifestyle. In this epidemic situation the most critical thing we are losing is Mental Health .People tend to experience fear of getting infected with the virus resulting in anxiety stress and depression. Good Mental Health and positive wellbeing can help better cope with the COVID-

19 threat and the uncertainty affected Mental Health conditions, affect a person's thinking, feeling, mood or behaviour which influences their ability to relate with others functions in daily life .Spending all of our time in our homes can be difficult, even for the most introverted and headstrong.

Pandemic situation has restricted our movements and Faced with new realities. Video broadcasting for example, Zoom, Google Meet, WebEx, Google Hangout to offer to learn at home which helps educators for Live stream classroom for students, working from home, use of Asynchronous learning Programme, unemployment, lack of physical and social interaction with relatives, friend and colleagues, students are missing stimulating and enriching environment and learning opportunities, home schooling. It is important that we take care of ourselves from mental and Physical perspective.

2.Mental Health :

Mental health is a dynamic factor that helps a person to adapt to a changing nature .It is closely related to concept of adjustment. It may be stated that the normal well adjusted, well integrated, emotionally and socially mature person has positive mental health. It is being cognitively, emotionally and socially healthy- the manner to think, feel, and expand relations. A state of harmony between self and other people and the environment. Mental health is a state of psychological development- a relatively consistent and enduring function of personality. It is a condition of intimate and social functioning with a maximum effectiveness and amusement. It involves positive feelings and attitudes toward the self and others. Mental health can be particularly seen in three cases:

- The Goodwill of the person can be noticed.
- Attempts to behave as desired by society are seen.
- Good adaptation skills can be noticed.

3. Behavioural Characteristics of Mentally Healthy Person:

Mentally healthy person possesses five behaviour patterns of subjective well-being-

3.1 A sense of responsibility:

A mentally healthy person have a sense of responsibility and is sensitive enough to understand the need of others and attempts to fulfil those needs for the Welfare of others.

3.2 A sense of self Reliance:

Mentally healthy person has confidence in his abilities and judgement to solve the problem without showing anger and emotional outbursts.

3.3 A sense of direction:

To attain the life goals a mentally healthy person directs his efforts, energy and creativeness.

3.4 A sense of personal value:

A mentally healthy person has its own philosophy of life based on conviction beliefs and goals that increases his happiness and the happiness of those around him.

3.5 A sense of individuality:

The Mentally healthy individual has separate and distinct identity. He attempts to develop attitudes patterns of behaviour that entail neither blind imitation to the demands and desires of others nor a rebellious detachment and isolation from others.

4. Mental illness:

Mental illness or mental health disorders is a broad term which encompasses a wide range of mental health conditions, disorders that affect our feeling, behaviour, mood and thinking. It can make miserable and cause problems in our day to day life such as workplace or relationships. Mental health problem can be influenced by response to environmental stresses, genetic factors, biochemical imbalance or with those combination.

5. Symptom of Mentally unhealthy person:

There are some symptoms of mental unhealthiest such as:

- They unable to concentrate in studies or work.
- Getting angry and very aggressive.
- Getting tensed for relatively trivial matters and run off often very impulsive.

- Feels very lonely, sentimental .Not easily able to forget and forgive a person.
- Always having a fear to loose and unable to take risks.
- Detachment from reality, paranoia or hallucinations
- Confused thinking.
- Significant tiredness, low energy or problems sleeping

6. Problem due to mentally unhappiness:

Mental health condition can cause distress, impact on daily life functioning and relationship, which are associated with poor physical health and premature death from suicide.

- Psychological Problems: Acute Anxiety, Phobia, Depression, Hallucination, Suicidal Tendencies etc.
- Physical Problems: Obesity, Acidity and Indigestion, Headache, Sleep disturbances, Hypertension etc.
- Social Problems: Adjustment Problems, Family Disharmony, Separation, Divorce, Loneliness etc.

7. Why should we Stay Positive?

Positivity is a core ingredient for successful coping skills in a crisis. This is the time for us to be pro-energetic for discover small moments of happiness in our days. A mind with positivity brings more peace and happiness, make good relationships with other and also responsible for every success of his life. Positive thinking means enthusiasm and positive attitude. A person with a positive mind-set would encourage and motivate people and make them feel good while mentally ill people make the whole environment distressed. Positive thoughts can create absolute value in our existence and help to enrich capability to build skills, develop resources for use later in life. Positive mind-set can go through a difficult time of our entire life in any kind of problematic situation. Negative emotions are not only bad for our physical and mental health but they also affect everyone around us. All type of activities of human being are directed towards a particular direction by making compatibility with different parameter of life .But sudden breakdown of such analogy makes people depressed. The coronavirus lockdown and the news along

with the uncertainty and ambiguity have a negative effect on our mental state. We need to have faith, believe that each conclusion has a beginning, it's just that we need to belief the process. We think negatively but we have to overcome pessimistic thoughts by constructive thinking. We have to focus our mind learning new skills

8. Pro-Active Steps for Staying Positive:

- **Distract Ourselves:**

Stop people from deliberating horrific news by offering a distraction. It can reduce blood pressure back to normal levels.

- **Meditation:**

It teaches how to stay quit when our preliminary considerations and responses are intense and potentially negative. When we focus on the best in ourselves, our potential strength can emanated and we can deal with the solution of practical problems in a vigorous way.

- **Reframe the situation:**

It's worth thinking about how we can apply in our daily life. Can each moment or day be about doing better we can in a stressful situation ('I will maintain proper hygiene and social distancing') rather than focussing on an outcome out of our control ('I will not and cannot get sick ')?

- **Balance our Social Media consumption:**

Social media can make us feel depressed with bad news but for many it is also a key way to stay updated and connected with friends and loved ones.

- **Music:**

Any creative work of human mind is the outcome of synthesis of reason, intellect and intuition. Music is the better way of knowing by which we are able to realize the ultimate reality, and the essence of true music can be realized directly through intuition. Music is essentially pure because by it musical minds can be free from all painful mental disease. True musician must have creative mind which should have:

- A broad canvas of the subject under consideration.

- Concentrative on the subject.
- Having an open, non-judgemental, unbiased mind, and
- An ability to capture the flash of thought.

By these essential conditions of intuitive mind we may say that when we want to appreciate the aesthetical nature of music we should have: broad sense of music, meditative and creative mind, open minded attitude towards true feelings, and a lot of effort to realize the essence of music. The aim of Indian music is to realize the truth, the real, the bliss, the ecstasy and the joy. Music is spontaneous creation of human soul. We can stay positive and reduce our depression by listening music. It plays a role in activating pleasure-seeking areas of the brain. Music bring out responses promoting positive sensation, alleviation of stress, and immune function.

- Regular exercise: Being in isolation during this pandemic situation regular exercise plays a vital role in helping maintain a healthy immune system deal with pathogens. Regular exercise slows down changes to reduce the risk of infection .These infection are more likely to be linked to stress, insufficient sleep, inadequate diet, pathogen exposure at social gathering.
- Instead of dwelling on problems be in solution focused thinking:

It can be easy to see enormous problems, negative obstacle, we have to change the mind-set. We have to be problem solver. A solution focused approach builds on success, focusing on the future and uses tools such as scaling and exception finding to gain clarity and direction to be more positive into our life.

- Communicate calmly without anger:
If we find ourselves getting upset when talking to someone, then take a deep breaths to relax and refocus so we can easily lash out our anger and communicate calmly and effectively.
- Improve relationships: In lockdown period take the opportunity to create memories, spend quality time and improve relationship with our loved ones .All these gestures

create intimacy and boost our oxytocin hormone which helps to emotionally bond people together.

- Cognitive Behavioural Therapy (CBT):

It can change the way we think and change our negative thoughts into Developing Creativity positive ones. It can be helpful to write down thoughts in order to reframe them.

- Devote ourselves developing our creative abilities:

We have to set goals and put time aside each day to develop our skills. Focus on casting off terrible mind or self-criticisms which would impair our ability to increase robust innovative skills.

- Increases resilience:

When in stress if we experience positive emotions then resilience increase and have a faster cardiovascular recovery. Having confidence in our own ability to respond and deal with crisis, it is a great way to build resilience for the future. Having caring and supportive people around us acts as protective factor during this crisis time. Maintaining hopeful outlook is a main part of resilience.

- Get crafty:

Arts and crafts can provide a number of Mental Health benefits. Art is a fruitful way to lower stress. When we become immersed in creating art, our mind break away from distracting thoughts. Finished work of our creative venture provides a burst of self-esteem that brightens mood by increasing neurotransmitter dopamine.

- Healthy eating regularly:

Eating well-balanced and nutritious foods can improve our immune system, decrease stress and let out endorphins our happiness hormones.

- Brainstorming:

It is a very useful method for educational and professional states but it is a commanding parameter for developing our Creativity. In brainstorming process, people must be concentrate in a particular

topic with high concentration, as a result he/she can keep him/her far away from unnecessary mental hazard, resulting a successful outcome. It helps to be positive and make a successful endeavours.

9. Creative Thinking:

Creativity is the potentiality to assume or invent something new. Creativity is not the cap potential to create out of nothing but the ability to create new thoughts by integrating, transforming, or reapplying present thoughts. Creativity is characterized with the aid of using the capacity to perceive the world in new ways, open mindness a craving for change and novelty, find hidden patterns, make connections between unrelated phenomena, and to generate solutions, accept change and newness. Creative people work hard and retain try and enhance thoughts and solutions, by making moderations, changes and refinements to their works.

Creative thinking is the generation of new ideas within or across realm of knowledge drawing on or deliberately breaking with established symbolic rules and procedures. Factors like originality, spontaneity, expansion, flexibility in work etc. are inherent in the creative production of a person. In this ongoing Corona crisis, people are bounded to think more acutely engaging their minds in creative works by constructive ways. One positive thing about being home is that one can finally spend time by reading, listening to music and audiobooks, classes are being taught online to ensure social distancing, masks are being made at home, watching recipes by online platforms, playing games, accepting fitness challenges through online mode, Yoga, meditation, creative writing, finding new ways to help the vulnerable and many more ways to contribute during the outbreak. People recognize that this lockdown has given enough time to prepare for the future and has given the opportunity to do something different. Creative Thinking look after our imagination.

10. Characteristics of Creative Thinking:

- Receptivity
- Curiosity
- Wide range of interests
- Attentiveness

- Connection seeking
- Conviction
- Complexity

11. Benefits of Creative Thinking:

- Creative Thinking give wings to a person to generate multiple ideas.
- Creative Thinking develops the ability in a person to solve problem perfectly.
- Creative Thinking can change a person whole attitude.
- Creative Thinking can be a ticket to success and great accomplishment.
- Creative Thinking can give a person a completely new Outlook.
- Creative Thinking provides self-awareness.

During these quarantine and isolation days means countless and aimless hours of sitting is accompanied by two things: constraints or restrictions and boredom. We believe constraints restrict creativity, it actually has the opposing effect. Constraints force us to rethink and look for new solution for problems. Many of us have surprised by their newfound skills. Since the past few months we noticed that social media feeds cluttered with creative posts by musical instrumental, baking, singing, dancing, calligraphy and much more. It is extremely important to express one's self, especially through creative outlet. The part of the brain which regulates stress, response and emotions is the limbic system and the amygdale prepares us to fight response. These centres are bound to be simulated in this period leading to feelings of fear, anxiety, and sadness. For getting the flow of things which is completely absorbed by something is creative activities.

12. Conclusion:

Positivity boost our problem solving abilities as well as our judgement, decision making, cognitive flexibility, productivity and creativity. Creative thinking means bringing a fresh, and sometimes

unorthodox, perspective to our work to be more productive. Every darkish cloud has a silver lining, it's a chance to thicken that lining and charge our mental fitness in order that we will pop out of this experience stronger.

The Effect of COVID-19 on Lifestyle Management and Mental Health Issues

Ajoy Das

ABSTRACT

The spread of COVID-19 has left the world in a state of and uncertainly. This is how the near is constantly being spread in the media. Despite various is spreading at an incredible rate in many countries. Thousands of people are being infected and many are dying. The medical system of many country is breaking down under the pressure of patients. Millions of people have seen, read and heard these news, intense anxiety, depression, and depression has profound effect on people's mental health.

This is causing anxiety and fear anxiety, panic, depression, insomnia, Instability, Aversion to action, Anorexia her vasa, diabetes, high blood pressure and even horrible events, such as drug abuse and suicide. Approximately 20% of Indian population suffer from mental health according to the World Health Organization.

The main topic of my paper is the effect of COVID-19 on human life and mental health and what can be done to cure it. Remedies such as regular exercise, yoga, meditation, self- assessment, self-awareness, and various creative participation, like regarding books and positive thinking. Above all everyone from children to the elderly should keep in mind that it is important to protect the body as well as mind, if we can control the mind through mindfulness or meditation then every person mental health seems to be fine.

Keyword:- COVID-19, Depression, Fear, Panic, Diabetes, Instability, Anxiety, Suicide, Yoga, Meditation, self-assessment, Self-awareness, World Health Organization.

1. Introduction:

Following the same rule every day, the clock was ticking in own rhythm. Suddenly the minute and second track stopped and the pressure increased on the clock. He wonders today when the minute and second track will move when we will get back to the old rhythm. The same situation in today is human society the stress of mental life seems to have become dangerous to get stuck in people's lives.

In December of last year 2019 the coronavirus spread on Wuhan the province of China, in the absence of antidotes, in fraction control is important in maintaining social or physical distance, but problem is that physical contract is necessary for mental health because touch control the Release of various hormones in the body, which gives rise to the necessary feelings and relieves stress. According to Medical Science positive touch increases the secretion of the hormone dopamine, serotonin and oxytocin on the human body and reduce the release of cart Rizal which lead to positive emotions such as inspiration, satisfaction, security, stress release etc. Avoiding prolonged contact can create emotional distance, impede a child's development, reduce immunity, and create additional stress.

2. Mental health issues:

2.1 Children:

Multiple researchers say children are relatively less likely to be infected with the coronavirus, but they are silent victim of the coronavirus. Children under house arrest are suffering from loneliness due to the spread of coronavirus worldwide. The effect of stopping teaching in the classroom is causing behavioral changing in the child leading to depression and mental illness. No school, no meeting with friends no play, no way to go anywhere. As a result of just the fear of weather around as a devastating effect of the child psyche. This result in malnutrition, loneliness, peer mood, inattentive study and the baby's immunity system is weakening and the baby is feeling sick all the time.

2.2 Adolescents:

Adolescents are likely to have pre occupation with themselves a sense of insecurity, mostly identify with their peer group and are often prone to risk taking behaviors. They also lose regular contact with friends because school, college and Universities are closed. This may lead to feeling of boring, loneliness, sadness, aggression and irritability towards siblings and other family members. Few many starts using tobacco, alcohol, cigarette etc. To handle their boring, loneliness and emotional changes. The uncertainty about examination and its impact on their career choice can exacerbate the stress due to the prevailing COVID-19 pandemic. Some adolescents may have feelings of being invincible and may take risks by not maintaining personal hygiene and social distancing. Others may be withdrawing afraid of leaving home and worried about their health as well as that of their family members.

2.3 Adulthood:

The common mental illness in older adults are depression, delirium, and dementia. Older adult with prior history of depression are at risk of relapse or worsening of depressive symptoms. This could be due to psychological stress, poor coping as well as difficulty in ensuring adherence to the routine treatment. They have challenges in understanding the COVID-19 pandemic related prospective measure and related information. It is difficult for caregivers to restrict mobility in older adults with dementia. It is also difficult for older adult with Dementia to be compliant with frequent hand cleaning, social distancing and use of the protective facial mask so it is mostly mental pressure of older adults.

People between the age of 30 to 50 who have been infected with the coronavirus have also feel fear, anxiety depression, uncertainty etc. Those working in the private sector feeling uncertainty about job security.

Again, those who are on daily wages are under emotional stress due to the creation of their earnings.

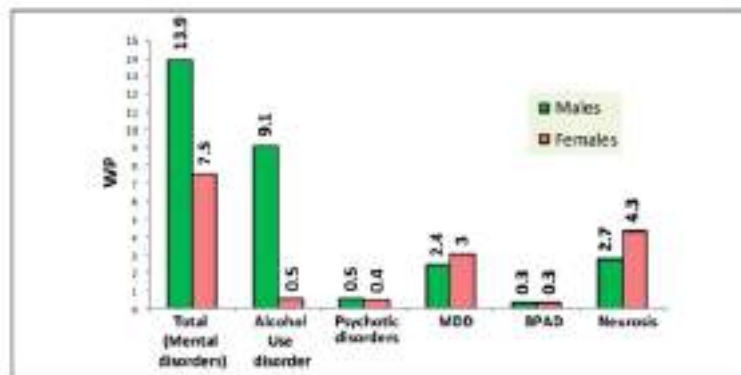

More miserable situation of educated unemployment young brother and sister. Those who have with lack of money and the uncertainty of a new job.

2.4 Suicide under the influence of COVID-19:

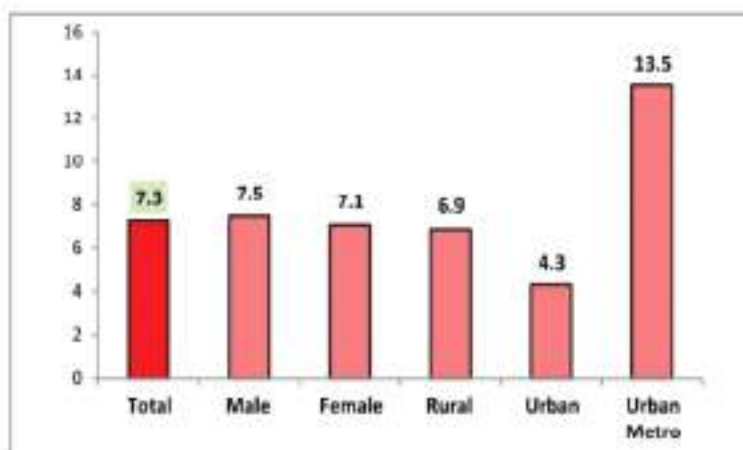

- On March 29, 2020. The finance minister of the German state of Hessen committed suicide out of frustration and Anxiety of COVID-19.
- Sujoy Ghosh and Anukul Roy Bharat Sanchar Nigam Limited contact workers died on March 27, 2020 from extreme uncertainty and frustration of earning of family under the influence of COVID-19.
- Balakrishna of Andhra Pradesh committed suicide by hanging himself thinking he was affected of COVID-19.
- A 34- year- old nurse in Italy become infected while trying to treat a Corona patient. So, he committed suicide with extreme city and fear to protect himself from his family.
- Corona committed suicide jumping from the roof of a hospital in fear and panic when a Chinese student was kept in isolation in Saudi Arabia on suspicion.

2.5 The risk is increasing towards the use of drugs: Under the influence of COVID-19 many young people are addicted to drugs to escape their mental depression while under house arrest hard as Gutka, smoking, drinking alcohol, taking sleeping pills

Prevalence of mental disorder by gender(%)

Prevalence of mental disorders (%) in 13 - 17years by age and residence

The risk is increasing towards the use of drugs: Under the influence of COVID-19 many young people are addicted to drugs to escape their mental depression while under house arrest hard as Gutka, smoking, drinking alcohol, taking sleeping pills etc. According to the World Health Organization at least one in four children and adolescents between the age of 15 and 19 in the world are drinking alcohol which is extremely worrying. At present I think the number will increase (National Mental Health

Survey of India, 2015-16: Summary).

3. Suggestion for the above mental health issues:

3.1 Children:

This guide is especially for parents of children

- Children are constantly exposed to information related to the pandemic in newspaper, TV News Channel, and social media. They many understanding have realistic and some exaggerated fears. They must be provided clear information regarding the pandemic in an age appropriate language. The aim is the reassure them and reduce exaggerated treat perception.
- Aware your children query but figure out a way of striking a balance. Too much information can cause panic and severe anxiety. Take your cues from the child.

- Make sure that Children are not excessively exposed to pandemic related information. Limit media exposure, especially if there is fear mongering or exposure to alarming content if the child hears or sees something upsetting, please put it in context for them. Avoid discussing the topic frequently in front of children.
- Family time can include games that parents may not have had a time to play thus for. This is a good opportunity to re-connect with the family playing board game, cards, carom, antakshari etc.
- You are their anxiety barometer Do not transfer your anxiety on to children.
- If the child already has a mental illness please reach out to your doctor via phone or email.

3.2 Adolescent:

What parents of adolescent kids need to do?

- Parents should keenly observe for only emotional or behavioral changes in their adolescent kids. Sometime these changes can be stable.
- Excessive use of mobile and other device can result in behavioral addiction. Parents must negotiate with adolescent to ensure the limited use of gadget and to discuss the inclusion of healthy non-gadget activists as a part of daily routine.
- Children take risks with drugs parents need to tell them to stay by their side. Then need to understand the bad effect of drugs.
- If stressed built up at home parents should be advised to focus on meditation or homework. Parents need to take care of regular exercise.
- If he is in attractive to reading due to the uncertainty of the current education system, advise him to read story books other than textbooks.

3.3 Adulthood:

- Make a routine for yourself and try to other do it. However, in doing so care must be taken not to put pressure on the mind. Sleep and get up at specific times.
- Those who are working from home should stand up for a while. Remove their eyes from the screen of the laptop, computer and wear clean cloth even if they are working from home.
- Read books, listen to music, watch movies while do whenever you like. There are a lot of things you can do that you have never done before or have never had a chance to do.
- You can take online courses from different universities in the country and about to improve your skills such as opportunity may not be available anywhere.
- Take extra care of those who have children and older people in their family become the mind is very good feel in this time.
- To keep the body healthy, practice regular exercise and to keep the mental health good it is very necessary to do yoga and meditation regularly.
- Those who are suffering from job uncertainty claim your mind thing that good times will surely come. Try to Income at home, the Mind must be good.
- Educated unemployment youth pay more attention to your study and claim their mind through meditation and yoga then mental health will be better.
- Do not give up your life no matter what happen because nothing is more valuable than your own life. So, love your life, death is not the only solution of life.
- Those who are already suffering from mental illness must consult a Doctor. The older should walk indoor in the morning and evening.

- Think about spiritual thought, keep your mind being with honest thought. You will see that your mind will be better.

4. Conclusion:

World mental health day was first celebrated on October 10, 1992. However, these days of service was not a theme. The theme of World mental day started from 1994. The first theme was to “increase the quality of Mental Health Service around the world”. At present it is a matter of prevention of suicide. The World Health Organization (WHO) says 15 to 29 years old are committing suicide every 40 second. The World Health Organization call on every citizen to be aware of suicide. Prevention and stress are the main cause of suicide.

At present the effect of COVID-19 is causing mind unable to cope with the pressure, many people decide to commit suicide. But we must remember that death is not the solution of life. We must be in the battle of life. So, everyone must be patient and bring peace of mind.

Thakur Sri Sri Ramakrishna Paramhansa Dev has is saying that-

Ye saya, se raya ; ye na saya, se nasa haya;

There for protecting the body as well as the mind is important in dealing with COVID-19. Just as you need awareness to stay physically healthy, you also need to stay mentally healthy become both are equally important. I hope that the mental health issue and its suggestion as I mentioned if you follow them regularly mental health will be fine. Patience is a very important currently time to maintain mental health.

According to Swami Vivekananda-

“Pull yourself out of danger. You must do your rescue..... do not be afraid. Do not despair that you have failed again and again. Time is limitless, keep expressing your strength repeatedly the light will come.”(CW: 8V/132P, 2V/403P)

In the end, this is what I will say. The night must pass. At the end of the night. We will understand something clearly at last. I wish you to stay healthy for the day, stay in peace and of course be free from the effects of COVID-19.

A GLOBAL PERSPECTIVE OF E-LEARNING: DURING LOCKDOWN OF COVID-19

Rajib Lochan Samanta

ABSTRACT

Educational system has been continuing in a traditional way. But due to the sudden fall of pandemic situation already has changed its track. There was direct teaching learning method, which applied all the schools, colleges and universities but this kind of concept like-e learning will be sudden applied to the learners. No body can't make out this kind of concept of learning will arise in front of the through different kind of applications like 'Google meet', 'Zoom' etc. This way of learning process among students, who are familiar with a web based technology. This is the main aim of the research paper, which will be helpful to all the learners to improve the self- study skill of the students, it has great role for solution. The conclusion of this paper shows that e-learning has become quite popular among the pupils all over the world particularly in the pandemic situation.

Keywords: Educational, Traditional, Pandemic, E-learning, Applications, Technology.

1. Introduction:

We know that the aim of education is to be perfect when it is to be mold by a person. E-learning we can define that learning experiences of various synchronous using various devices like mobile phone, desktop, laptop with internet access. Naturally, we

don't know how we will be adapted with this system. But the pandemic of Covid-19 has boarded to face this kind of circumstances, which already has begun to come to know the future education system through web-series. The use of devices like smartphone, desktop, laptop with internet connection for forms a major component of this learning methodology. Sudden fall of this situation has forced to shut down all the education sectors but education will not best of any way and any circumstances. Therefore we are habited new generation of teaching using in education system to continue it. Never it will bestop.

1. Significance of the study:

This kind of methodology will help the student attitudes towards e-learning and will be help to find out way of learning, which may be motivate the learner during covid-19 pandemic. All the educational institution has tried to enhance the student knowledge and skill through digital technology. At first time of lockdown period there has no particular perspective to continue the education system by the government and educational department. After that they have abled to provide better infrastructure for e-learning for the betterment of the students. Regarding the contribution of e-learning during this pandemic was done for the students, who are studying various educational institutions will help them additional information for those students.

3. Objectives:

The trend of using e-learning resources help among the students how to overcome the present situation.

To identify the interest and attitude of pupils across the world using e-learning.

Using e-learning resources by the students across the world help to suggest prospects.

To gain the knowledge using e-learning method across the world.

To help using new kinds of technology across curriculum.

To gather suggestions to make popular online learning and affective in future.

4. Research Methodology:

The above mentioned objectives in order to achieve primary data was collected using Google form to make the survey result representative the students from all the stream of higher educations were included. There has included commerce and management of arts, social science and technology on behalf of the institution Rishi Aurobindo Institute of Teacher Education has taken initiative role to collect the survey report on economic condition, education system, natural life style, health during COVID19 period all around the institution surrounding of Medinipur district. These have used various kind of problematic, which include on the above noted subject related. The representative of institution went door to door and threw various type of questions, from which has arisen various kind of problems.

5. Problems associated with online Teaching and Learning:

For online Teaching-Learning process there has needed more electronic devices like smartphone, laptop, desktop etc. But may be somewhere lack of devices problems will be arise. On the other hand as those are electronic devices may be arisen more difficulties during utilize. Also may be arisen the problem of proper electric supply. In the rural areas there are more difficulties like above mentioned problems. To continue e-learning process there has needed all kinds of equipment but difficulties of economic background they are not able to survive with this environment. So they go to the background from the main stream of education system. But in the urban areas maximum students easily they can survive because of getting all kind of facilities. But little bit of problem may be arrived any circumstances due to the difficulties of network problem and devices

6. Possible solutions for problems:

To continue e-learning process may be arrived a lot of difficulties but we should not ignore these process. How we can survive that moment we should think about those problematic. Therefore we have needed to continue pre-recording video lectures, which will be held in the difficulties part of the learners by providing from others. The

quality of the sources should be improved continuously and teacher must try to give their best to the learners. We should have needed design the online programs for better solution of our requirement.

7. Role of government:

Beginning of lockdown period there was no initiative steps towards the education but after has gone few days the government of India has shown their initiative role and directed to use numerous online platforms positively by involving students with e-learning process through Information and Communication Technology (ICT). Human Resource Development Ministry (HRDM) working under to bring out numerous initiative towards e-learning process. The University Grants Commission (UGC) and its Inter University Centres (IUC) informational and Library Network (INFLIBNET) and Consortium for educational Communication are the main part of in-these network. The teachers, students and lectures accessed these platforms. Any circumstances the government is not leaving the schedule of study materials through various platforms. Most of the technological tools that means ICT are SWAYAM, MOOC (Massive Open Online Courses), E-Pathsala, SWAMPABHA, e-SHODH SINDHU etc. Sponsored resources by the government are other e-learning platform which are interactive and can be accessed from home. Through this platform the teaching method is faculty has to first at their students to the list. After that upload their lectures, course materials, audio instruction etc. Maximum students who had on the roles of higher education institution, for them smartphone and other devices are irrespective of economic health in urban areas. There fore E-learning method can hold ground till the virus is contained web management system or easy class learning management system is a platform that allows educators to creat e online classes where they can store study materials. Various kinds of aspect like assignment, quiz and exam monitor due date, grade result with feedback all in-one place. At present status for organizing e-learning classroom through Zoom app, Google meet, Jio meet etc. which help teachers to video conferencing, collaboration, virtual classroom and increase student participants and learning retention.

8. Impact:

Sudden conversion of traditional system of-learning is not too much easy for all of the learners to continue. But the situation has bounded for future planning of education process which is the major challenges for the pupils. For the rural areas delivering the education content with special reference to their syllabus would be a major problem. The most of the student in rural areas naturally suffer from network problem, proper supply of electricity problem and lack of devices. But the India is nation of diverse language cultures, customs, who lives in rural areas at a certain moment they can able to accept the design of platform online system. There-fore it is the most challenging moment of which appear in-front of them various kind of e- learning platform now support extensively spoken language to grand benefit to the majority of the population.

9. Conclusion:

Although it is the new methods of learning various kinds of devices but in-future it will be best suited for everyone teaching learning method. There has needed availability and comfort to utilize this medium. This process to help the students for up-gradation and to access update contain which they have needed for better future. Anyhow this circumstances have aroused by the COVID-19, pandemic situation. The learners, who will be implement properly this concept will help them for how methods and techniques whether apply in coming future.

The Role of E-learning in COVID-19 Crisis

Sayandip Mondal

ABSTRACT

Education is one of the important factors so on create good nation. Education are often considering as a backbone of any country within the planet. Usually in pandemic time the governments are used to close all the tutorial institutions and other governmental institutions for sometimes. Whole the earth is fighting the unique and dangerous virus called COVID -19. It has been spreading in most of countries like India, America, Australia, Bangladesh and other countries. The outbreak of corona virus disease (COVID-19) has been impacting many of us and threatening their life across the planet. Government of India are taking all necessary steps to make sure that we are prepared well to fight against this pandemic situation. One of these necessary steps is that the lockdown because of the speed spread of this virus. The aim of this study is to means the importance role of e-learning in COVID -19 crisis. The technology has been playing a superb role during this crisis. E-learning tools has been helping the training to review reception. Finally, the searcher has shown the role of e-learning in COVID-19 crises.

1. Introduction:

Education is one among the important factors so as to create good nation. Education are often considering as a backbone of any country within the world. Usually in pandemic time the governments

are wont to close all the tutorial institutions and other governmental institutions for sometimes. Whole the planet is fighting the unique and dangerous virus called COVID -19. It's been spreading in most of nations like India, America, Australia, Bangladesh and other countries.

The governments of most countries have ordered to lockdown and asked the people to remain at their homes thanks to the danger of this virus on human life. The teachers in several countries have started using e-learning in teaching the scholars during this period. Technology has been advancing and may say that we live in industrial revolution. The technology features a vital role in several filed like business, medicine, and education. Etc. E-Learning are often defined because with the help of computer and internet technologies we can deliver a broad array of solution to enable learning and improve performance.

E-learning being within the presence when firstly used the word at CBT system in 1999. Other words have begun also to spring up in search of an accurate description as virtual learning and online learning. Nevertheless, the ideologies and values behind e-learning have recognized through the history. There is indication which proposes that early forms of e-learning existed as far back as the 19th century.

E-learning is taken under consideration as new method of teaching rather than face to face teaching. E-learning has the facility to provide and share materials altogether kinds of formats as e-mails, slideshows, videos, PDFs, and word documents. It is also conducting webinars (live online class), communication with teachers via message and chat forum is additionally an option available to user. Using e-learning are often considered as bridged which cause you to feel as if you inside the classroom.

Due to the importance of E-learning, different searchers are writing within the world of e-learning. Kawatra, P. S., & Singh, N.K. (2006). This study has discussed the concepts of open and distance learning. It also has examined the effect of internet on the teacher's role. The searcher has also explored the sorts of skills and methods

that teacher to be effective in online learning. This paper has provided a vision into innovative multi-channel delivery modes adopted by the varied universities.

Anderson, J. (2005). This study has explained how IT changed our life. It's shown also the role of ICT in teaching within the faculties. This study has focused on importance of e-learning and therefore the way it combined the pedagogy and technology. The searcher has to draw conclusion that why E-learning is significant in teacher development.

Mohammadi, N., et al (2011). This study has showed the importance of e-learning and its application in education process and compared it with traditional kind of education. It also has provided advantages and disadvantages of e-learning in learning. The researcher when mentioned the above related studies was able to bring out this maiden thought into his research done on the role of e-learning in COVID19 crisis and to means the important of it in several fields. This paper goes to means the role of e-learning in COVID - 19 crisis.

2. E-learning:

E-learning could also be a technological tool has been used for teaching and learning. Basically, computer and internet are essential to enable transferring of knowledge and skills. The applications of e-learning include, computer-based learning, web- based learning, virtual education opportunities and digital collaboration. Content is provided via internet, audio or video tape, CDROM, and satellite TV. E-learning are often self-paced or instructor-led that include image, media within the type of text, animation, and streaming video and audio.

E-learning features a special feature like its simply web-based training, which suggests you don't get to put in software or CDs on your computer. Internet connection and an online browser are all you'd like. Watch, listen and learn as training professionals demonstrate each lesson right your monitor.

Always available, means all of the courses are available 24 hours each day, 7 days every week. Purchase your subscription once, easily

login for direct access to your courses. Courses are designed by software training professionals with years of classroom training experience. Anyone is in a position to find out from his/ her home and office. Free access to E-manuals, which suggests the subscription contains access to classroom e-manuals (PDF), alongside practice exercises and keyboard shortcuts. Modify your training with easy to use menu. Clear, easy to follow, step by step instruction meaning anyone can watches the training sessions repeatedly he/she wants to, while practicing in software, make it the foremost representative practice available.

E-learning are often described because the best and most convenient thanks to learn on your own. Comprehensive, means all of the topics is roofed and included in classroom trainings.

3. Role of E-Learning in English Teaching and Learning

The advanced development of computer and knowledge technology has been offering a favourable external environment for English teaching. many learners of English round the world. Information technology is providing them with rich teaching material of English. It furnishes a chance to teachers for changing their pedagogical strategies and to reinforce the efficiency of teaching and learning. If we keep enforce giving emphasize to grammar and vocabulary, then the learners are only be ready to pass the exam easily and can't master the language.

Moreover, the utilization of e-learning effects on second teaching and learning process. The learners are coordinating with e-learning and using of computer and modern technologies and this may help them to extend and enhance their knowledge. E-learning are often considered as of the advanced teaching style than can provide the teachers an ingenious idea and help them to possess their own electronic method. Thanks to the importance of the e-learning, a number of the teachers organized or arranged programs to show their students.

E-learning is just like the buzz word in every educational environment. It's important to infuse the technology in education because it provides the requirements of this learners. Nowadays, the

environment of the classroom is totally different from the normal one. The normal methods depend upon the lecturing and rote which won't improve English skills among the learners. There are new technologies become an important a part of our lifestyle like internet, mobile phones, you tube, blogs, tweeter and lots of more have added not only stimulus but also learners' engagement and real interactivity within the classroom. The teachers can encourage the learners to enhance their language skills by utilizing the innovation ELT techniques like English songs, dramatic, sports commentaries, movie clippings, advertisements etc.

Finally, the e-learning tools have been changing the way of teaching and learning English. Information and communications technologies (ICT) include the communication devises and new digital technologies such as email, audio equipment, cameras, and video conferencing have not been only influencing and supporting what is being learned in schools, colleges and universities but it also has been supporting changes the way students are learning.

4. Role of E-Learning in COVID-19 Crisis:

While the entire world is fighting the invisible enemy (COVID-19) which has been killing thousands of individuals round the globe but the teaching and learning process are still keep it up by using e-learning and its tools.

In India, the govt. went for lockdown all the cities to scale back the spread of COVID-19. Thanks to ongoing of COVID-19 a noticed significant has seen in increasing of the number of scholars who are using the platform and apps of ED-TECH and online companies.

Different companies like Vedantu, Unacademic, and Byju's have offered free access to measure classes to the scholars so as to continue their learning from home. Byju's co-founder and Director, Divya Gokulnath, said, during a press release, "Since our announcement last week, we've witnessed a 60% increase within the amount of latest students using the app to find out from home daily." We can understand the role of E-learning which is playing in this pandemic situation from the above statement.

Nowadays, students are accessing the teachings increasingly on different apps which will help the scholars specially who are in higher grades be ready for the approaching year. Moreover, Gaurav Munjal, co-founder and CEO at Unacademy declared that “within the last three weeks, learner who are watching free classes have increased by 3x. We are clocking 30 million minutes of watch time on Unacademy every single day. Our educators started taking more live classes”.

Furthermore, Vedantu has been offering free access to measure classes to students and schools in several states in India like New Delhi, Bengaluru, Hyderabad and Kerala. Coursera are often considered together of the e-learning platforms within the world, recently has declared that it'll provide every impacted university round the world, including India, free access to their catalogue through Coursera for campus till July 31.2020.

Generally, most of universities after the lockdown in India requested the school members and therefore the students to use e-learning applications for the tutorial purposes and one among these universities is Aligarh Muslim University. The administrator has requested the school members to upload the PPT of lectures and study material in PDF form on their webpage of the university website or on another electronic modes like WhatsApp and/or email to let the scholars encounter them during the lockdown.

The searcher has contacting with students who are studying in abroad to inquire about e-learning status in their countries during COVID-19 crises. In china, after spreading virus specifically in Wuhan city, the govt. has ordered to shut all institutions like schools, universities, markets etc. The teachers have started teaching their students via e-learning applications through uploading PDF, online class and ask the scholars to try to their assignments and send them by WeChat app and /or email.

In Iraq, Google classroom has been used for uploading the study materials. Google classroom helps the scholars to seek out the fabric associated with their subjects easily and study its reception. In Turkey, applications like Teams and Zoom are used widely. The discussion

above has shown the good value of e-learning in teaching and learning. E-learning has assisted both students and teachers in COVID-19 crisis.

5. Conclusion:

Staying reception is one among the steps to slow the spread of COVID-19. Thus, the all universities, colleges and schools are closed India and other countries. Technology becomes an important a part of our lifestyle. E-learning, internet and computers are used vitally in teaching and learning process. This study has proved and shown how E-learning and using applications like Zoom, Teams, Veev, Google classroom and lots of others are helping the scholars to review at homes in COVID-19 crisis.

LOCK DOWN AND THE INDIAN ECONOMY

Avik Chanda

ABSTRACT

Covid 19 pandemic slowing down many business, industry throughout the world. Every country hit badly by this pandemic. India also worst hit countries in the corona virus pandemic. Many common people lost their job in pandemic. Indian economy was improving day by day but pandemic slowdown the growth process. Last week of March Indian Govt. order for lockdown. Many migrant worker lost their job and forced to come to their own home. Many small scale industry stopped their work due to lockdown. Employment rate is rising day by day. Loss of job and drop in income mainly effected lower and middle income group people. Village people in India more suffered then urban people during the pandemic. During the pandemic tourism industry hit badly. Because no one don't like to travel in this pandemic time. Service sector also effected by the lockdown process. Now Indian government has announced three rounds of stimulus package for the country, including direct cash transfers in packages provide some relief in individual's hand.

Keywords: *Pandemic, Economy, Industry.*

1. Introduction:

India is one of the world's worst hit countries in the corona virus

pandemic .India has more than 1.6 million cases of infection from January to August 1st week . But relative to the population size, the percentage of infected people is still very low. In India the number of people who have recovered is higher than affected people from virus.

In India lockdown started in last week of March and was later extended many times. Tough restrictions stopped most economic activities and work and caused problem millions of people, most of them are daily wage earners, who lose their jobs.

According to the International Monetary Fund, India will be the largest economy in the world very badly hit by the COVID-19 pandemic. Now the Fund now says that Indian GDP in the ongoing financial year 2020, which start in March 2020, will commitment by 4.5%. Just a few weeks ago, it had been predicting only 2% growth for the ongoing year.

A slowdown of this economic process will have enormous human significance. By some estimates, the loss of three months' income and work would leave millions of people sink in poverty, back warding all the gains made since the Indian economy was liberalized and stabled in the early 1990s. Worse, the government's finances are pinched. Tax revenues are set to crash and India's earlier relatively stable debt-to-GDP ratio may energize toward 90%. Controlling the spread of the COVID-19 will exsanguinate state and central resources.

The economic condition in India caused by the lockdown is terrible. Nearly 84% of Indian households are seeing decline in income since the lockdown start, sharp and big negative impact on people's income as the pandemic shrink their living capacity. Nearly one third of all households will not be able to pull through beyond a week without other assistance, it showed, that strident statistic finds affirmation in the unemployment rate, which had meet 27% in early May, and up nearly four-fold from levels in January-February, according to various study the unemployment rate has since decreased to less than 24 %.

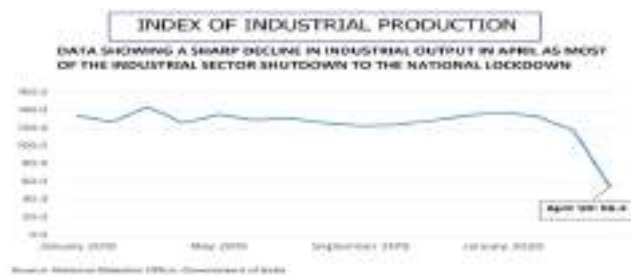

The drop in incomes affected people in the lower and middle class of the income distribution most badly, study found. Households in the lowest of the five income groups had average monthly per-capital earnings of less than Rs. 3800, while those at the highest end made between Rs. 12,374 and upwards of Rs. 1 lakh.

Households in the middle-income family are hurt badly more perhaps because they are most likely to be dependent on sources of income that are strike due to the lockdown. The families in the highest quintile are more likely to have stable salaried jobs, and they have capacity to work from home and continue to earn a lively hood. Families in the lowest quintile may be more heavily intense in occupations that have continued despite the lockdown time (e.g., agriculture, food vendors, and hawker) or have benefited from selected transfer programs.”

Village people and economy have seen disproportionately more suffered than those in urban India during the lockdown periods. Incomes have dropped at some 88% of village households, compared to 75% at urban households, the study found. Higher-income households and peoples in urban area in India have shown more “resilience” than their rural area counterparts, because working out of home is possible for many city jobs, and for that they are relatively protected from others.

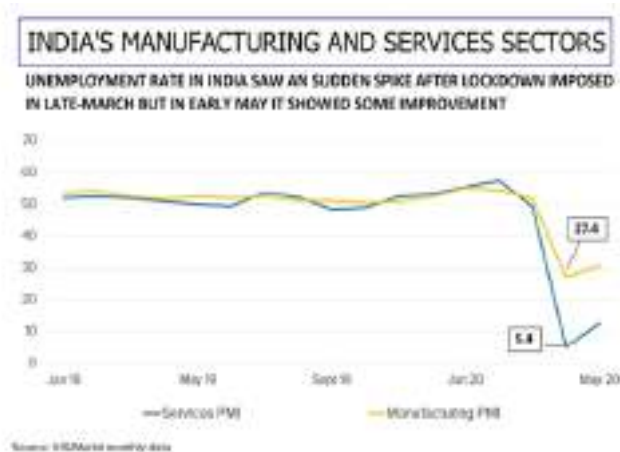

The effect on Nations’ gross domestic product for the current quarter will not be known for some more month. Bellow charts will shows how economic activity obstruct during the lockdown period.

Fig. : 1: Index of Industrial Production

In India industrial and commercial production fall sharply in April when the whole country went to lockdown and most of the factories and industries were not in operation. That includes sectors like mining, manufacturing and electricity, automobile. Manufacturing of consumer items and goods saw the sharpest decline for that month. The index shrink to 55.6 % compared to same time a year earlier.

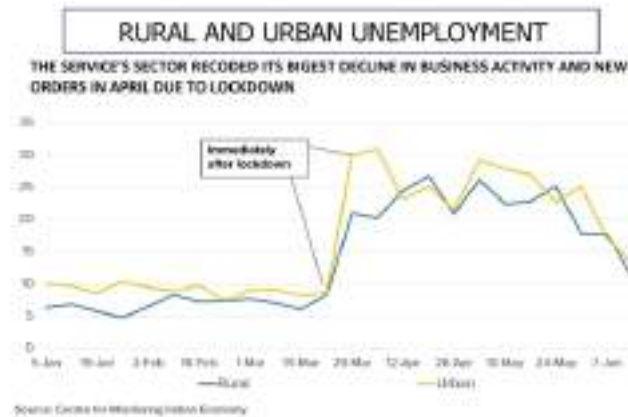

Fig.2: India's Manufacturing and Service Sectors

The service industry stopped working in April as the most of the business and commercial service were shut down due to the lockdown. Various survey showed 'extreme decline' in service activity. The service business activity index assembled by the firm came in at a shocking 5.4 far under an industrial forecast around 40. Reading above 50 indicate growth while those below that level represent decrease.

Business activity in the service sector also fell drastically in May as the pandemic obstruct operations, reduced footfall in shops and led to decline in demand. Domestic tourism and travel sector also declined sharply, in a result that show a huge fall in service business.

In the lockdown period daily turnover lost for the auto manufacturing for each day of closure was around \$300 million per day.

Fig. 3: Rural and Urban Unemployment

Various survey, data, media reports all suggest the millions of people in India lost their jobs due to the lockdown. This lockdown affect mostly daily wage earners and low income households.

Information compiled by the centre for monitoring Indian Economy appear that the unemployment rate in rural area and urban area increase sharply in last two week of March. It remained relatively high in April. Survey showed the unemployment rate fell to 5.8 % from a more than four-decade high the previous year.

Economic Support

The Indian government has announced three rounds of stimulus package totalling nearly Rs 21 Trillion (\$266 Billion) that includes a 7.2 trillion liquidity package that RBI unveiled in February before the corona virus which is followed up with the measures to stem the pandemic – induced economic slowdown.

The direct cash transfers in packages provide some relief in individual's hand. That includes 500 rupees per month to 204 million women with bank accounts. 800 million household will also get free food grain. But this type of benefit can't reach to poor urban household because they have not satisfying document requirements.

Get Ready for the Next Eco Lockdown

Sibu Dey

ABSTRACT

The lockdown process is currently underway around the world for the reason of COVID-19 pandemic situation. As a result, all human beings in the world are under house arrest, so their economic activities are almost closed. So the environment around the world today is much more pollution free. But when the lockdown phase ends, people will be involved in various economic activities again, then the environment will begin to deteriorate again. Maybe this time people will be involved in so many economic activities that the environment will face extreme catastrophe.

Keywords: *Environment, Lockdown, Pollution, Eco-Lockdown, Sustainable Development.*

1. Introduction :

There is always a negative relationship between the environment and human economic activities. As human economic activities are progresses then environmental degradation also accelerates. Once again, as human economic activity declines, then environment gradually returns to its former stage. At present our environment is undergoing an unprecedented change. The main reason is, COVID-19 pandemic issues. From December, 2019 the Lockdown Situation for is going on in different countries of the world. About five million people around the world are under house arrest. All kinds of economic activities, from industrial production to transportation, to

road construction, to building construction, everything are often closed. In such this situation, nature is slowly recovering.

2. Situation of Environment During Lockdown:

2.1 Positive impact on Air pollution :

The transportation system is one of the largest sources of air pollution in the world and then there are different thermal power plants and different types of industrial activity. The amount of greenhouse gases in various countries around the world is declining drastically. PM 2.5 or particle materials 2.5 is a toxic atmospheric component, Which is mainly responsible for various types of diseases ranging from our various respiratory problems to infections and asthma. The predominance of PM2.5 in the skies of Delhi was so high that players had to wear masks in various Ranji cricket matches. So the concentration of PM 2.5 in the air has also been greatly reduced in Delhi, and If we look at the situation of greenhouse gasses oriented pollution in Delhi would increase drastically almost every year But, in the current lockdown situation, it has been completely reduced. Even to reduce air pollution in Delhi, the Delhi government made arrangements to drive even and odd numbers. Delhi, once known as India's most polluted Area, is now plagued by air pollution. Not only Delhi but every state in India has the same situation. Satellite images show that greenhouse gas emissions have dropped sharply, from China to Western Europe and even in USA. As a result, the sky has become clearer and clearer so that at night some of the stars are clearly visible. The level of pollution has dropped so much that the Himalayas are clearly visible from Jalandhar in the Punjab, about 30 miles away, after many long years. The closure of mills or factory has also reduced the amount of toxic acid rain in the air. That is why different types of stone cancer or skin cancer are being prevented in the world.

2.2 Positive impact on world climate change :

Ozone levels are slowly recovering as the less emissions of chloro-fluorocarbons. There is also a huge improvement in the global hit budget. This will greatly reduce the global warming. And then, starting with the melting of ice in the Polar Regions, the sea level, the amount of fires, cyclones, desertification, aridity, etc. will

decrease. In a word, nature will be able to organize itself beautifully again.

2.3 Positive impact on Water pollution :

The river water has become clear and transparent as the absence of various industrial work and municipal functions. Sewage also decreased significantly. The amount of dissolved oxygen in the rivers has increased and different types of fish are also seen coming near the wharf to play. After a long time, dolphins can be seen roaming in the Ganga Ghat of Kolkata. The two most polluted rivers in our India are the Ganges and the Yamuna. From the Central Government to the State Government, various policies have been adopted to decontaminate various rivers in India. From the Ganga Action Plan to the Manama Ganga various projects, crore of rupees have been spent to make the Ganges pollution free, but the nit result was nothing. Efforts have been made to decontaminate not only the Ganges but also the major rivers of India starting from the Ganges to the Jajuan, Godavari, Krishna, and Kaberi so many. But all of the efforts have failed to do it, only few months of lockdown properly done that work. The rivers have been revived today in the absence of all economic activities of people. Specifically Ganges and Yamuna have also been able to overcome a lot in this lockdown situation. According to various people or saints on the banks of the river, after about thirty to forty years, the rivers seem to be flowing so clearly.

2.4 Positive impact on Noise pollution :

Throughout the year, noise pollution was widespread in the streets and alleys of the Puja festival. The roar of the mic, sound box, various sound monsters, and fireworks was completely off in this lockdown situation. And with that, of course, there is almost no noise pollution, due to the less traffic congestion. Not only in India, but all over the world, due to the violence of these sound monsters, many people became deaf, dumb and also suffered from heart disease. The amount of noise pollution in this lockdown situation has been greatly reduced.

2.5 Positive impact on wild animals & forest Ecosystem :

In this lockdown situation, various forest resource (Fuel wood, honey, leaves, flowers, fruits, the act of hunting animals and birds

etc.) collection activities are almost closed. Due to the reduction of the forest resources like afforestation on the one hand, the air pollution has decreased. On the other hand, Due to the closure of this type of human activities, various wild animals are also seen roaming freely. They are also seen roaming the streets of the locality. According to environmentalists, the impact of this lockdown will be greatly increased in the case of animal reproduction. The number of obsolescent and endangered species will also continue to increase. It will restore the food-eating relationship (mainly food chain and food web) in different forest areas and with it try to keep balance of the ecosystem.

However, almost all types of environmental pollution have been reduced today.

3. Forecasting of environmental Situations after lockdown:

3.1 Soil and medicinal wastes oriented pollution :

Even after all this, there are some negative effects on the environment. And is expected to read more in the near future. The number of online or offline food orders is increasing as people are under house arrest in the lockdown situation. As a result, a lot of plastic or polythene is being used to pack them, but the bullets are being thrown away after use. Not just online food orders, but lots of products are being ordered throughout online from Flipkart Amazon etc. Moreover, those who come to collect these discarded items, they are also not seen furring this lockdown situation. As a result, the amount of soil degradation is increasing tremendously.

To combat or prevent COVID-19, use of face masks, sanitizer wide, hand gloves etcetera are increasing day by day, for all individuals, including all hospitals and nursing homes. According to various studies, the amount of medical wastages in hospitals or nursing homes has increased about 5 to 6 times. Again, due to the high risk of infection from these, all type of recycling factories are almost closed. Also, recycling factories are suffering due to lack of workers and adequate raw materials.

3.2 Negative impact on all kinds of pollution, not only soil pollution :

Also the most frightening situation that is about to come is that in the aftermath of the Lockdown episode when the world will recover again, human economic activities are gradually increasing then Environment Will go downs. Because when the lockdown phase is over, then every country will want to bring back its economic prosperity. So industrial production will increase, transportation communication will increase and use of energy resources will also increase. As a result, the environment will return to the previous situation.

4. Conclusion :

As a conclusions we can say about it that's, the well-being of the environment these days will remain just a matter of dreams or entertainment for us. There have been different pandemic situations or different viral infections in the past centuries and that time people were under house arrest and the environment returned to normal for a while or for a few months. But history has shown that in such a situation, when human activities resume, the environment begins to be polluted again. To meet the massive needs of this huge population will greatly increase the oppression on the environment. Then in the near future we may have to go into lockdown again to save our environment. One thing we need to keep in mind is that nature is not just for our human communities. Not only human beings actually all other living communities have the right to enjoy or use this nature. But we as human beings have risen to the top of our abilities and are using nature in a brutal way, for our own self-interest, we will do more after the lockdown, just as we have raped nature in the hope of making more profit.

So in order to prevent that situation from happening, every people and also the government, should take the right steps and take the responsibility. We should be there, At least help nature and promise to use nature properly to protect ourselves and for our future generation. In particular, the government needs to come up with some sustainable plans or policy to maintain this progress in the current environment and ofcourse we who are educated students, teachers,

and also the responsible Indian citizens, we have to fulfill important responsibilities. First we have to be aware of ourselves and then we have to spread the revolution of that awareness in the whole society, then we can save ourselves, and also our future generation. Otherwise we have to prepare for another Eco-lockdown.

E- Learning is an Outstanding Contribution of ICT During Pandemic Period

Mintu Pal

ABSTRACT

Information and Communication Technology E-learning or E-education has played an important role in the current COVID-19 situation. Not all of us are aware of this e-education because in a developing country like India, e-learning has not been developed in such a way except in the service sector. This e-learning requires a variety of components by which we can organize this system, such as mobile or laptop or various e-learning apps such as Zoom, Skype, Google Meet and advanced 4G internet connection. But in our country, due to the inadequacy of those elements, and for various reasons, this e-learning system is hampered, such as-

- ❖ Teacher and students lacking digital skill.*
- ❖ Internet accessibility.*
- ❖ Device availability.*
- ❖ Struggle for parents.*
- ❖ Privacy concerns.*

I have tried in this paper how to overcome all those obstacles in the current situation of COVID-19. It is discussed how this E-learning system can be better managed in the current COVID-19 situation or what steps the government can take to get more benefits.

Key word: - COVID-19, E-learning, Zoom, Google Meet, Skype, Internet, ICT etc.

1. Introduction:

The current COVID-19 situation has changed a lot of things related to our social life, one of which is the education system. There are an important factors in order to build good Nation and one of these factor in education. Education can be considered as a backbone of any country in the world. Usually in pandemic time the government are used to suspend the schools, college, university and other Government and non-government institution for sometime .Whole the world fighting the unique and dangerous COVID-19 virus. E-learning is one of the most effective means of exchanging information between teachers and students. So the question is, what is e-learning?

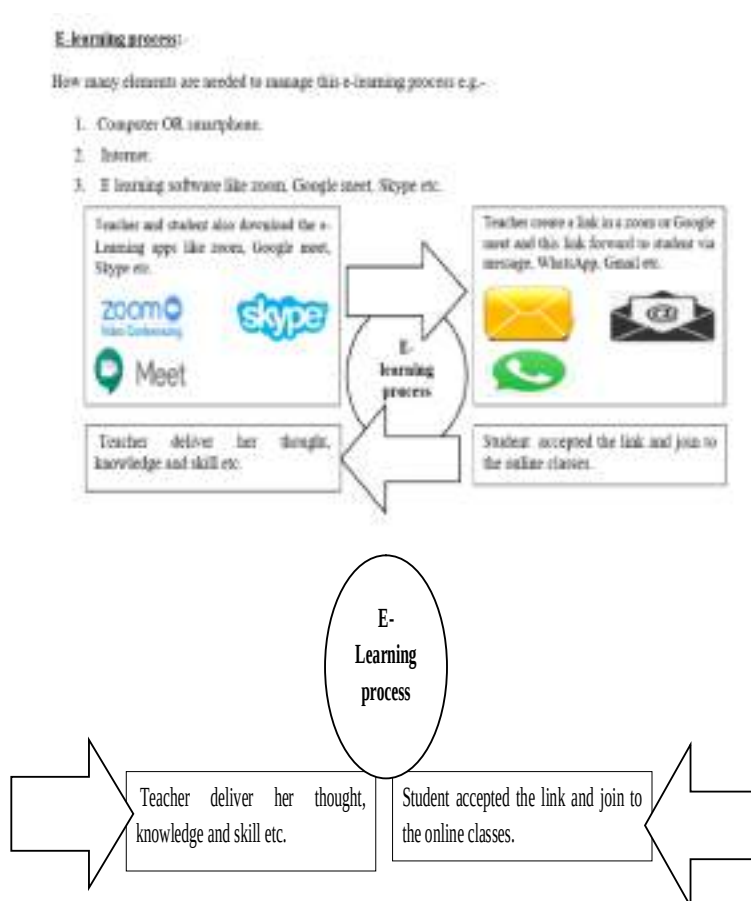

Education through e-learning is not usually confined to school-college, so it is a form of open education. At the same time many types of education can be given here. E-learning education is called Network Based Education. Here information is exchanged between teachers and students through network or internet.

Although this e-learning system is prevalent in many developed countries, its use in India is scarce except in various service sectors, but its importance is increasing in the current situation. According to UNESCO since the outbreak of COVID-19 began some 1.37 billion students in 138 countries worldwide have been affected by school and University closures. Nearly 60.2 million school teacher and University lecturers are no longer in the classroom. Since the whole country is under lockdown .University, College and other institution faculties are setting up accounts on online video conferencing platform services zoom, Google meet, Skype and Google classroom among other to engage with students.

2. E-learning process:

How many elements are needed to manage this e-learning process e.g.-

- ❖ Computer OR smartphone.
- ❖ Internet.
- ❖ E learning software like zoomGoogle meetSkype etc.

Fig.1: Showing the different kinds of E- learning processes

3 Barriers of E-learning process:

Since this E-learning system is new in the field of education in our country, we have to face some obstacles in this e-learning system, those obstacles are as follows-

3.1 Barrier for Students and Teachers: Lack of digital Skill :-

The main problem in e-learning is the lack of digital skill of teachers. Since teachers in developing countries like India have not been able to acquire teaching skills like in developed countries, the current National Education Policy- 2020 has encouraged teachers in

this digital scale and other fields. Learning should be taught so that they are encouraged the students.

3.2 Internet accessibility:

In a country like India where internet facilities are currently scarce, it is very difficult to implement e-education or e-learning system. Where in the world the average 4G internet speed is 32.01 Mbps, in a country like India the internet speed is 11.46Mbps. In order to increase the speed of internet, the present government has emphasized on submarine cable from which we get high speed internet.

The Niti Aayog, in its “Strategy for New India@75” report, highlighted the quality and reliability of the internet as a major bottleneck. It also pointed out that 55,000 villages in the country are without mobile network coverage. Among students from rural households, only 28% are likely to have internet access at home.

3.3 Device availability:

Although the government has taken adequate steps to deal with the Internet situation, all the devices required to use the Internet are mobile, computers or laptops. In a developing country like India where education has not yet been accepted as a fundamental right, this learning system is just a fantasy and the computer, laptop used for very few people.

Although about 78 per cent of India’s 1.3 billion population has mobile phones, in rural areas is around 57 per cent, according to the Telecom Regulatory Authority of India. Nearly 68 per cent of the students in higher classes have access to a smartphone.

3.4 Struggle for parents:

While e-learning is effective in higher education, parents, especially children between the ages of 4 and 12, do not have a mobile phone, so parents have to provide online classes on their own mobile or laptop, while parents have to do their own office work. The problem is again in the case of the current situation, in the case of the parents who do the work from home, there is a gap between their own work and the child’s education.

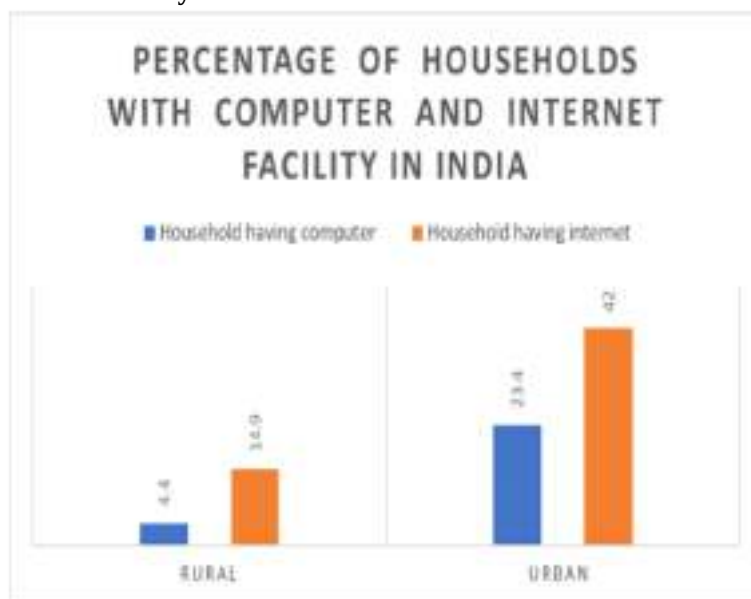

3.5 Privacy concerns:

Over the past two months, the teleconference software Zoom has seen explosive growth, it's easy and convenient in use. But the convenience has also come with increased scrutiny and a slew of uncovered security screw-ups. Privacy concerned people are finding it difficult to use such software.

The current situation is, of course, an unpredicted one. However, we should always be prepared for such situations.

Giving a global perspective, UNESCO noted, “Half of the total

Fig. 2 : Showing the % of Households with computer & Internet facility in India

number of learners — some 826 million (82.6 crore) students — kept out of the classroom by the COVID-19 pandemic, do not have access to a household computer and 43 per cent (706 million or 70.6 crore) have no internet at home, at a time when digitally-based distance learning is used to ensure educational continuity in the vast majority of countries” {National Sample Survey Report (2017-2018)}

4. Suggestion:

In order to make this e-learning system better, we must pay attention to a few things. It is discussed below-

- ❖ Special courses on how to improve e-learning digital skills for teachers and students should be arranged in government and various private initiatives.
- ❖ Since huge countries like India where there is a lack of internet. Despite the launch of 4G Internet, 2G Internet is not available in rural areas. To provide services in public and private enterprises there.
- ❖ It is not possible to overcome this barrier only with internet. Smartphones or computers for access on the internet are urgently needed. Cheap smartphones or computers can be provided at low cost with the help of Make in India. Such as “credible Chhattisgarh” by Chhattisgarh Chief Minister Raman Singh in 2012-13. Providing tablet and laptop by project. Or The Present Kerala Chief Minister Pinarayi Vijayan’s “KSFE Vidyashree” project to provide subsidy laptops.
- ❖ Above all, the government should focus on the privacy of the various E-learning apps so that no information is disseminated in any way. If there is such a problem, the cybercrime cell should be given a contact number so that those who have encountered this situation can contact him.

Financial Resilience, Globalization and Market Up and Down: Facing the COVID-19

Shamu Khatik

ABSTRACT

The absence of expectation of an overall troublesome occasion, for example, the spread of the COVID-19 joined with the breakdown of market systems for the most basic items expected to battle the infection left the legislatures of numerous nations uncertain of how to respond and, frequently, compelled their capacity to settle on vital decisions. The compassionate objective of sparing however many lives as could reasonably be expected came, in certain nations, at the expense of binding the whole populace, considered the main alternative accessible given the conditions. The monetary expense of such an answer which stand-stilled the economies of these nations and disturbed worldwide worth chains is probably going to be trailed by quite a long while of financial downturn that will overshadow the expense of the 2008 money related and financial emergency. In the light of this experience, we return to a portion of the verifiable presumptions fundamental the structure of our financial frameworks and examine a portion of the issues and compromises looked during this unpleasant period. The exercises educated could assist us with bettering envision or manage future Black Swan occasions.

Keywords: Markets, Globalization, Wellbeing, Emergency, Open strategy, COVID-19

1. Introduction:

The COVID-19 pandemic hit the world with uncommon speed, seriousness and expansiveness. Globalization added to the quick spread of this current plague to all edges of the world and worldwide market instruments on which we have depended in the course of recent decades to advance financial development and government assistance and on the adaptability of which we checked to climate remarkable and sudden occasions neglected to convey sought after help in an opportune manner, in this manner hindering numerous legislatures in their urgent endeavors to battle the spread of the infection. The absence of expectation of the conceivable event of such an occasion joined with the breakdown of market systems for the most basic items expected to battle the illness left the legislatures of numerous nations uncertain of how to respond and, regularly, obliged their capacity to settle on vital decisions. The philanthropic objective of sparing whatever number lives as could reasonably be expected came, in certain nations, at the expense of binding the whole populace, considered the main alternative accessible given the conditions. The monetary expense of such an answer which stand stilled the economies of these nations and disturbed worldwide worth chains is probably going to be trailed by quite a while of financial downturn that will predominate the expense of the 2008 money related and monetary emergency. The emotional occasions of the primary quarter of 2020 lead us to re-examine a portion of the verifiable suppositions basic the plan of our monetary frameworks and to consider a portion of the quandaries and tradeoffs that we have looked during this upsetting period. The exercises scholarly could assist us with bettering foresee or manage future Black Swans.

2. Science and Politics:

March 24, 2020 was per day of frenzy in the US on the grounds that for the subsequent time Doctor Anthony Fauci (the overseer of the US National Institute of Allergy and Infectious Diseases) was not close by President Trump during the president's day by day question and answer session. In France, we are informed that all choices of the President or the Prime Minister are taken in the wake of counselling a Scientific Council responsible for prompting the

legislature on the COVID-19 pestilence or are defended by the positions taken by this Scientific Council. Justly chose legislators are considered to have an order from the individuals; researchers are viewed as authentic specialists since they know more than the normal resident. However, unmistakably in a time of emergency the open places more trust in researchers than in legislators to educate on the proper course concerning activity to battle a pandemic. Be that as it may, this brings up numerous issues about the separate jobs of researchers and government officials in open arrangement dynamic in the midst of emergency. Would scientists be able to raise issues on their own drive to impact political choices? Or on the other hand should their job be restricted to addressing addresses raised by political pioneers? Do we expect that political pioneers will consistently follow the counsel of researchers and if not by what means will we be made mindful of contrasts in their perspectives? This issue has been brought up in France by the Government's choice to permit the organization of hydro-chloroquine (not yet experimentally tried for use against COVID-19) for patients in grave states. The choice was made by the Government subsequent to looking for the counsel of the researchers.

We know that mainstream researchers has been exceptionally condemning of the Professor of Medicine in Marseilles who initially proposed that hydro-chloroquine could be a valuable medication for COVID-19 patients. Clearly his the primer examination didn't meet the logical models for a total clinical test. The inquiry at that point is how did the Scientific Council come to recommend or bolster the political choice? Did the Scientific Council act on the side of the Government or did it satisfy its logical job? There are connected inquiries regarding the duty of specialists in the turn of events and control of the pestilence. Their work and their dedication to helping the populace beat this sickness are outstanding and specialists are paying an overwhelming accolade. They are our saints, they have our regard and our deference. In any case, it is very agitating that experts of virology are partitioned on the right approach. There are obviously totally different perspectives on the best procedure to battle a pandemic of this nature (bind the entire populace? test each one to

attempt to distinguish all the people in danger?), various thoughts regarding the convenience of covers, various thoughts regarding what how meds untested for COVID-19 ought to be utilized, various thoughts regarding whether China made the best choice or not and so on... So the contradictions among specialists are not restricted to auxiliary issues. Regardless of whether it does not shock anyone that specialists can deviate, the inquiry at that point is what is the authenticity of a warning body comprised of specialists who dissent (the specialist who has been supporting the utilization of hydro-chloroquine and was an individual from the Scientific Council to the Government has recently reported that he won't partake any more drawn out in the Scientific Council's work)?

3. Human rights and the reaction to the wellbeing emergency:

Non majority rule nations, (for example, China, Vietnam) where singular opportunity is constrained appear to be better ready to take sufficient measures (for instance restriction in China or focused on activity in Vietnam) to restrain the spread of the infection than somewhere else. In some western nations (US, GB, France and so forth...) there appears to have been, at the absolute starting point at any rate, more faltering about repression measures (or less extreme restriction measures) and in this manner a more prominent inclination for the infection to spread. Another part of this interface is the hesitance communicated in various nations (in light of an connection to singular opportunity and regard for security) with respect to the utilization of present day intrusive advances, for example, facial acknowledgment or geo-location which could assist open specialists with monitoring the exacting implementation of the constringent request when a Government has recognized that a control request isn't as a rule very much followed by people in general. The level of protection from the utilization of such innovations to follow expected casualties of COVID-19 differs starting with one nation then onto the next. For instance Slovakia (following in the means of nations like Singapore, South Korea and Taiwan, where forceful contact following has urgently added to restricting the spread of the infection) on March 25th 2020 passed a law which permits the administration to utilize information from telecom organizations to

follow the developments of individuals experiencing COVID-19 to guarantee that they are maintaining isolate rules. The reception of this law was difficult yet the Slovak Justice Minister demanded that notwithstanding this plague the privilege to security couldn't be total (see "Slovakia to follow casualties through telecoms information", financial Times, March 26, 2020). Be that as it may, in Germany the legislature was less fruitful and compelled to forsake its proposition to utilize "specialized signifies" to recognize who had been in contact with people contaminated by the COVID-19. In France the administration chose to utilize police watches to screen whether constringent measures were being trailed by individuals discovered outside their homes. In any case, it appears glaringly evident that the utilization of further developed innovation may have permitted us to spare scant HR which could have been assigned to significant elective undertakings, for example, the coordination of providing emergency clinics and their security. This brings up the issue of how we should manage the compromise between general wellbeing and the insurance of human rights.

4. Logical system and the preparatory rule:

Third, there is an inquiry concerning the separate benefits of logical approach and the prudent guideline to illuminate open strategy making. This inquiry isn't new in Europe yet the current emergency offers another outline of the predicament to be confronted. With regards to hydro-chloroquine, mainstream researchers demands that right clinical system has not been followed and that all the more testing is fundamental. Notwithstanding, the inquiry that can be posed is whether, in an emergency, we have the opportunity to follow right technique. What occurred in Marseilles shows that the reaction of numerous residents is, I couldn't care less if the right logical system has been followed, I need to be tried and to have this medication recommended on the off chance that I have the infection in light of the fact that there is no elective medication and I chance biting the dust. To a limited degree, governments (the French Government, President Trump) have felt an enthusiastic inclination to fever their residents against researchers (thus the situation of the French Government that this medication can be given to passing on patients

under certain conditions). The understood inquiries at that point can be: Isn't the logical (judicious) approach an extravagance that we can't generally manage? Isn't the preparatory standard (at any rate now and again) a superior other option? Do we have an orderly technique to propose for managing the difficulty? Another part of this discussion is the conversation about whether the French Government ought to have kept bigger supplies of covers, respirators, drugs and so forth. In 2009 the French Government, stressed over the improvement of the H1N1 infection purchased monstrous amounts of antibody to treat this malady and huge amounts of veils. H1N1 never turned into a pestilence in France and the legislature was quickly blamed for having squandered open cash. From that point onward, the Government let France's load of defensive clinical hardware reduce to such a degree, that France is currently unfit to respond when there is a plague. From an open approach viewpoint, the inquiry is : How should we manage the danger of uncommon, yet especially dangerous occasions, (for example, pandemics, serious quakes, extraordinary climate occasions, atomic mishaps and so forth...)? How much would it be a good idea for us to accommodate these dangers (that have a little likelihood of happening) while doing so will be expensive however could spare numerous lives? Or then again would it be advisable for us to concede that we would prefer not to get ready for such occasions (both due to the cost in question and due to their unconventionality)? Yet, all things considered, what should we do to guarantee that our monetary frameworks stay adaptable enough that they can respond in an ideal way when such catastrophes do happen?

5. The monetary expenses of general wellbeing systems:

Fourth, there is an inquiry concerning whether there can be a compromise between general wellbeing procedure and financial methodology used to defeat the emergency and if there is such a compromise what strategy remedy ought to be followed. The possibility that there might be a compromise originates from the way that containment approaches (intended to limit the quantity of passing's from COVID-19 and received in a number of nations) reduce the effect of the plague as far as the quantity of individuals

tainted however decline financial yield, and accordingly the seriousness of the monetary emergency since residents are forestalled either from going to work or from proceeding to work if their occupations are not appropriate for telecommuting. The segments monetarily generally influenced by the current repression measures are administration parts, for example, air transport, inn, eateries, retail circulation, films and so on the grounds that in those divisions telecommuting is generally unimaginable. In this way the broader and the more drawn out the repression, the more serious will be the unfavorable impacts in those areas and the bigger will be the reduction of GDP. There are two elective wellbeing methodologies. One is to let the scourge run its course, which would infer a lot more passing's yet a much lower decline in GDP as the individuals not contaminated and the individuals tainted with just light side effects (which speak to the vast larger part of survivors of COVID-19) would keep on working. The other is to test the populace generally and keep just individuals contaminated by the infection. In this subsequent case (which is suggestive of the technique embraced in nations like Korea(1), there would both be less passing's than if nothing were done and a larger number of individuals working than if a system of general control of the populace were followed. The procedure picked in European nations may well exacerbate the financial emergency contrasted with that subsequent from elective systems. From this point of view we can expect that the monetary expense of the pandemic will be a lot of more awful than the expense of the 2008 budgetary emergency for the basic explanation that individuals, generally, continued working during the money related emergency. Some contend that this system could force a GDP misfortune on western economies of up to 15% of GDP in the short run and require numerous long periods of exertion to attempt to return to where these economies were before the scourge. What the compromise between wellbeing technique and monetary methodology really is and how we ought to consider this compromise while deciding open approach bring up both exact issues (requiring presumptions about the seriousness of the financial emergency in various arrangement setups, the speed of recuperation, and so forth..) and moral inquiries, (for example,

regardless of whether, with regards to wellbeing strategy, one can or should put a monetary incentive on lives). President Trump's call to resume the US for business by Easter Sunday and his contention that you can't show a nation to tuning in to specialists in light of the fact that the fix they would support (containment) could be more regrettable than the malady was an especially severe method of raising the issue.

6. Globalization, worldwide flexibly chains and national sway:

The advantages of monetary globalization have been tremendously examined in the course of recent years. One view is that the decrease in exchange and unfamiliar speculation deterrents and the advancement of new interchanges innovations have permitted a global reallocation of assets through a rebuilding of creation forms which has profited created nations by permitting them to make sure about their utilization needs at a lower cost and permitted creating nations to profit by monetary open doors on account of the improvement of fare arranged exercises. It is frequently brought up that globalization has lifted a huge number of individuals in creating nations out of neediness. In any case, the COVID-19 emergency could reinforce the hand of the individuals who, in created nations, see monetary globalization and exchange and venture advancement as inadmissible dangers to the power of their Nation State. According to those doubtful of the advantages of globalization, there are a few manners by which exchange and venture advancement constrains the capacity of Nation States to seek after free household approaches. To begin with, the conceding of exchange concessions important to ensure a successful access to the local market of products or administration from unfamiliar exchanging accomplices typically suggests surrendering exchange assurance apparatuses which could have been utilized to ease sectorial challenges on account of residential emergencies. Second, liberal exchange approaches permit firms working in altogether different residential administrative conditions to contend on world markets. Concerning, firms in nations with the most noteworthy residential norms regarding human or social rights or property rights or natural insurance or food security and so forth. Might be off guard as to firms in nations with less demanding

norms. In this way, to a limited degree, opening up to worldwide exchange obliges the capacity of nations to unreservedly settle on the household cultural decisions that they might want to make. Third, the improvement of international exchange, along with various late innovative advancements in the correspondences and transportation parts, has prompted an internationalization of flexibly chains whereby local firms externalize various capacities to nations where such capacities can be satisfied at a lower cost, (for example, bookkeeping and account in India and mechanical creation in China, or all the more as of late in Vietnam). Be that as it may, this internationalization of the worth chain, regularly joined with in the nick of time arrangements of keeping stocks at the most minimal conceivable level so as to decrease costs, make firms particularly subject to the smooth working of the global worth chain. Such smooth working can separate when an outside stun influences the economy of any of the nations where firms adding to the worth chain are found. In a world described by financial globalization, interruptions due either to a characteristic calamity influencing another nation or to a political choices by an unfamiliar government can upset the capacity of firms to serve their local markets. Accordingly, regardless of whether through exchange concessions or through the danger of seeing their local firms dislodged by worldwide rivalry or through the unavoidable results of unfamiliar disturbances, exchanging countries may appear to have enabled up to secure their organizations or their residents. It is the last instrument which has, up until this point, been a wellspring of worry in western nations during the COVID-19 pestilence. European and North American nations currently depend to a huge degree on far off nations, for example, China, for their gracefulness of various basic clinical results of which they needed more stocks to confront the COVID-19 wellbeing emergency. This reliance turned into a significant wellspring of concern when a few nations, for example, China, where the sourcing firms are found were hit by the pandemic and chose to follow a severe repression strategy which stopped their creation. European and North American nations were then unfit to restock veils, respirators or dynamic fixings utilized for testing and this restricted their alternatives to battle the infection. In France, for

instance, since the start of the COVID-19 pandemic, there has been an intense lack of FFP2 veils which should ensure wearers both against the airborne transmission of the infection and against the chance of breathing in the infection. It has even been hard to give enough careful covers (which offer a lesser degree of security) for the wellbeing experts managing patients tainted by pestilence. The purposes behind this deficiency of covers are twofold. To begin with, in 2011 and 2012 French specialists turned around the decision they had recently made to keep a significant load of covers based on the possibility that China, which produces about 70% of the world gracefully of veils, would have the option to furnish France with the important covers if there should be an occurrence of a crisis. Second in late February, when it turned out to be certain that the plague was going to seriously hit France and that France required veils, the scourge had hit China with full power and a huge bit of the Chinese populace had been restricted. Thus, while the hypothetical Chinese creation limit of covers was assessed to be around 20 million veils for every day, China was possibly delivering 15 million covers because of containment estimates when the Chinese household interest for covers had shot to somewhere in the range of 50 and 60 million covers for every day. Not exclusively was China not in a situation to send out its covers to France however it had become an enormous merchant of covers from Indonesia and Vietnam. At the point when the French firms whose representatives need to utilize defensive FFP2 covers, (for example, development organizations and other modern firms whose laborers are presented to residue and little particles) got mindful of the approaching trouble to get such covers, they responded by endeavoring to build their own stores of the most defensive veils (FFP2). At that point the absence of accessibility of veils in drug stores made a frenzy which drove the French President on March 3, 2020 to demand all FFP2 covers accessible.

With slight varieties, a similar story happened in other European nations, for example, Italy and Germany. On the day when the French President demanded all accessible FFP2 veils in France, Germany restricted the fare of covers. Taiwan and India likewise found a way to stop fares of clinical gear. The circumstance in the United States

appears to have followed a comparable way. During 2005 and 2006 the US Government upheld the storing of defensive rigging in anticipation of pandemic flu and a vital reserve of 52 million careful covers and 104 million N95 respirator veils was amassed. Around 100 million of those veils were utilized in 2009 for the H1N1 pandemic and were never supplanted in the store. As the COVID-19 episode exacerbated in the US in the beginning of March 2020 and as the interest for veils developed quickly, the lack of covers, especially N95 covers, turned into a subject of debate. The deficiency was ascribed to a mix of low key stocks, broad purchasing of veils by on edge residents and decreasing gracefully (either because of accumulating or to diminished creation) from China (2). Strangely, on March 17, 2020 when the Centre for Disease Control (CDC) distributed a refreshed arrangement of proposals for enhancing the utilization of defensive apparatus by clinical experts and recommended that careful veils were worthy while looking at or treating a COVID-19 patient (a recommendation lined up with exhortation gave by the World Health Organization), this proposal was considered with extraordinary doubt by some clinical experts and specifically by the American Nurses Association which contended that the CDC's new suggestions were based "exclusively on flexibly chain and assembling difficulties", along these lines recommending that national power in the wellbeing segment was undermined by the financial powers of the worldwide market(3). Other than the way that the spread of the COVID-19 plague may have additionally dissolved the confidence of some in the advantages of financial globalization (perhaps unreasonably in light of the fact that in many nations a superior examination by national administrations of the conceivable cataclysmic dangers which could upset the government assistance of their residents and the appropriation of open careful steps against those dangers could have fundamentally diminished the effect of the interruptions in business sectors for basic merchandise), it ought to be noticed that the selection of essentially broad measures to mitigate the monetary emergency which will follow the pandemic is likewise prone to prompt a retreat from the rationale of globalization. In reality, as observed already,

obviously national governments should infuse enormous measures of cash into their economies with the expectation that organizations will, with this budgetary assistance, endure sufficiently long to climate the disturbance brought about by the scourge, restriction measures and the resulting financial downturn. For the reasons we have broken down before the bailout of our economies will require money related estimates a lot a bigger number of times more significant than those taken in the repercussions of the 2008 monetary emergency. In any case, one of the exercises we gained from that budgetary emergency is that when national governments go through monetary upgrade to shore their economies following an exogenous stun, they should ensure that their boost doesn't wind up supporting different economies through a flood in imports. To guarantee that there is no spillage they will in general retreat to protectionist apparatuses. As Simon Evenett and the Global Trade Alert have archived, a monstrous increment in protectionist measures followed the 2008 emergency. It is difficult to accept that a similar reason won't prompt similar impacts, especially taking into account the significance of the budgetary duties which have just been reported.

7. The requirement for modern approach:

Sixth, a worry identified with the recently examined question is the evident failure of market arranged nations to seek after a powerful mechanical strategy which is both favorable to serious and permits nations to keep principal quality in key businesses and assets which can be approached (or immediately initiated) in a period of emergency. The issue isn't new and has been effectively talked about in France and Germany in the course of recent years. However, while the conversation was to a great extent a conversation among business analysts and civil servants, the challenges experienced by various nations (counting France) to have a sufficient flexibility of straightforward things, for example, covers or dynamic elements for tests are seen by the overall population to result from an inability to follow a compelling modern strategy. Moreover, when we would particularly need to see household firms which despite everything have creation offices in our nations change their creation to items or administrations that are desperately expected to confront the

emergency (state, for instance the creation of respirators for medical clinic trauma centers), in France there is nobody accountable for arranging, sorting out, authorizing and overseeing this move since France no longer has a service of industry. So what has been picked up in productivity by depending on business sectors to coordinate the economy has made lost capacity to mount a planned reaction to an unforeseen monetary catastrophe.

8. Security, computerized innovations and general wellbeing:

Seventh, there are fascinating inquiries regarding information and advanced arrangement. As the Financial Times gave an account of March 24, 2020: “The corona virus emergency is driving the EU to redraw its advanced system. The past calls for EU information sway shows its restriction when to foresee the normal way of the scourge and to discover an immunization we are subject to getting the biggest conceivable pooling of information and when, to get this pooling of information, we need the participation from non EU nations like China. It was just a month back that it was accounted for that EU Internal Market Commissioner Breton was playing with driving European organizations to store and hold probably a portion of their information in Europe and told legislators that information created in Europe: “ought to be prepared in Europe”. We are plainly trapped in a difficulty between the longing to secure our protection and to keep the GAFAM from turning out to be always monetarily prevailing by taking care of their man-made consciousness calculations with our information and the way that in the wellbeing division as in different areas, the best exhibitions of the man-made reasoning calculations that we rely on to deliver logical advances, specifically in the wellbeing part, rely upon the amount of information which can be accumulated to prepare them.

9. What future for rivalry law and strategy?

Eighth, there are various inquiries concerning if and how the job of rivalry law and rivalry strategy ought to be re-imagined in a period of profound monetary emergency. A conversation on the objectives, accomplishments and disappointments of rivalry law implementation and rivalry strategy was started a couple of years prior. Be that as it may, in Europe, this conversation was to a great

extent concentrated, first, on questions identified with the shamefulness of worldwide rivalry from nations, for example, China, where government mediation permitted sponsored, state claimed endeavors to increase a generous bit of leeway over their Western rivals by implies viewed as both unreasonable and anticompetitive and, second, on the subject of whether the European spotlight on the security of rivalry in Europe (for instance, through merger control) had weakened the improvement of national or European victors and quickened the de-industrialization of Europe. In the US, there was likewise a worry with the injustice of universal rivalry among nations which had endlessly extraordinary financial frameworks and a doubt that the thin focal point of US antitrust experts on the security of customer surplus in the short run combined with a lenient disposition toward monetary fixation and an over the top dread of type I blunders (danger of confused intercession by rivalry specialists driving, actually, to a limitation in rivalry) had prompted under-requirement of antitrust laws, expanded full scale financial focus and net revenues and control of the computerized economy by the GAFAM. The merciless monetary emergency we are encountering now requires various kinds of changes, contingent upon the time viewpoint we consider.

In the extremely present moment, the primary issue to be gone up against is the ruthless disturbance in the worth chain of various items, prompting deficiencies either in light of deficient degree of creation or due to challenges in item appropriation because of restriction measures. The issue for buyers isn't, all things considered in a typically working economy, to have the option to pick the best value/quality proportion among items offered by contending providers however essentially to be capable discover the item (regardless of whether in littler amount than what might be attractive). In such conditions, first, participation among providers (as well as government mediation) to distinguish both the requirements and the current stocks might be important to allow a sufficient flexibly of fundamental merchandise and ventures. For instance, as the US Federal Trade Commission and the US Department of Justice have recommended, medicinal services offices may need to organize

giving assets and administrations, and different organizations may incidentally need to join creation, dissemination, or administration systems to encourage creation and appropriation of COVID-19related supplies. Second, buyers should be ensured against manhandles bringing about value gouging of items hard to come by. This requires two changes for rivalry specialists. First to adopt a more nuanced strategy concerning participation among contenders than the methodology they have taken before, and, second to concentrate on exploitative maltreatment of market power instead of on exclusionary rehearses (the making of hindrances to section) on which they have centered previously. Rivalry specialists both with regards to the European Competition Network and outside the EU (for instance, in Great Britain and in the United States) have just flagged their readiness to permit, at any rate incidentally, collaboration or coordination between contenders at whatever point such participation or coordination is important to keep away from a deficiency because of the COVID-19 emergency, or guarantee security of supply (4). They have likewise flagged their goal to battle cost gouging. In the medium run, say over next a few years, our economies will be discouraged, with the danger of an enormous number of liquidations of firms either straightforwardly hit hard by the COVID-19 pandemic (in the administration area) or influenced by the disturbance of their flexibly chain, rising joblessness and decreasing interest. As is generally known, rivalry is a high minded financial instrument when economies are at full work of their assets since it permits them, in a static point of view, to develop through a more effective utilization of scant assets. Be that as it may, with the consequence of the COVID-19 pandemic, in the medium run, we face the danger of a financial downturn, and a significant level of insolvencies and joblessness for various years. In such a domain the significant objectives are to rapidly animate monetary development, to take part in the sort of redistribution components which will reduce the financial enduring of poor people and to guarantee that the monetary structure that we make will be stronger later on. It will therefore be important to invigorate business and to help firms in the segments influenced by the emergency, especially SMEs yet in addition various bigger firms,

from failing. Monstrous measures of state help, charge reasoning or suspensions and endowments of different sorts or even the nationalization of whole parts will be important, notwithstanding the underlying money related bundles previously set up by the legislatures of numerous nations in Europe and in the US. In this specific situation, unmistakably there is a chance of contention between the need to misleadingly prop an enormous number of firms up in the short spat request to launch the economy in the medium run

what's more, to permit it to hold its balance over the long haul and an arrangement of rivalry law implementation which accept unequivocally or verifiably that the economy is as of now in a steady harmony with full or close to full work of the variables of creation and that the most significant issue is to guarantee that the serious procedure in the short run directs the allotment of assets to boost shopper government assistance. The advancement of rivalry may not be as focal a monetary distraction soon as it was during the initial too many years of the 21st century (despite the fact that it is helpful to audit the exercises of the period which followed the Great Depression) and to the degree that it is as yet valuable we should reconsider the compromises between static effectiveness, reallocation of assets through mechanical approaches, dynamic efficiencies and financial flexibility. At any rate, rivalry specialists should take a more drawn out and more powerful perspective on the procedure of rivalry than they have had up to this point and to adjust their prevailing upon regard to state helps, emergency cartels or mergers to conditions of disequilibrium brought about by an exogenous stun on the monetary framework. At last, in a more extended term point of view, the test raised by the COVID-19 emergency and the need to be more ready to confront future scourges require a gigantic reallocation of assets toward the wellbeing division. This isn't the main remarkable reallocation of assets that must be executed. We likewise should bargain head on with environmental change and divert our assets toward clean energies. The advancement of the computerized economy likewise requires a reallocation of assets to permit firms in customary areas to completely profit by the new innovations available

to them. Various financial experts have convincingly contended that market powers are without anyone else inadequate to reallocate assets at the level and the speed required to confront those difficulties. This implies if rivalry stays essential it isn't adequate to address the difficulties we face in the 21st century. Rivalry strategy must be better coordinated in a more extensive setting of reciprocal monetary strategies.

10. Conclusion:

Black Swan occasions and significant compassionate emergencies do happen and they can strongly influence created nations just as creating nations. One of the strategy interrogates we need to think concerning is if and what measure of our assets we need to commit to accomplishing stronger and coordinated financial frameworks better ready to withstand uncommon yet possibly disastrous occasions. There is no simple response to this inquiry on the grounds that neither the likelihood of such occasions, nor, now and again, their tendency or their potential for obliteration are known. However, as Jean Tirole contended as of late (*Le Monde* March 25, 2020) and as the experience of the COVID-19 emergency has appeared, the option is between settling on contemplated decisions for the future which may permit us to keep up some level of control even in desperate circumstances or letting future occasions run their course, choose for us and perhaps devastate every one of us. The time has come to move to a more drawn out term viewpoint and to all the more likely coordinate hazard factors in our financial examination and strategy choices.

ELEMENTS OF ERADICATION OF COVID-19

Pravati Das Mahapatra

ABSTRACT

The world today is afflicted with a deep disease. Due to the scientific activities and profit making of human beings, the ugly face of the goddess of nature is available today in the sense that people don't do it. The disease is a particularly abnormal condition or illness of the affected part or all the organs. The term illness refers to a pathological or personal aspect, which is the scientific concept of treating pathological abnormalities. This is possible when a person feels sick despite not being sick and vice versa and feels sick despite being sick. The term illness goes beyond both of those ideas, focusing on social consequences by article. Illness is similar to the social nature of the disease. In the case of physical and mental illness based on social outcomes, there interpretation and treatment and symbolic response very and reflect the extent of the disease. The main reason for the increase in the disease is that the body is conducive to the growth of toxins in the body due to the inequality of the action of air, bile and phlegm. Explained Ayurveda cosmology and physiology by the Panchabhutika theory, and diagnosed the cause of the disease. In the context of discussing the origin of diseases, it has been said in the Charaksanghita that the effects of air, bile and phlegm are at the root of all human diseases. If the body is not defective, the diseased seed cannot grow in the body. External disease germs can

infect the body and do no harm to the body. So bacterial infection isn't the cause of the disease, it is the consequences of the disease. Air, fire and Varuna are the three gods who are the creator of our creation. Creation is destroyed when the trinity is manifested. The body is sick with the slightest provocation of this trinity in the body. Death occurs in the body in special outbreaks. Yoga is our main help in building a body free from disease, decay and old age, and building a strong mind for spiritual progress. If we take refuge in this Yoga, mankind will be freed from the grip of decay, disease and untimely death and the miserable mortal life will become blissful. Yoga asanas, meditation purification of the mind are necessary to protect oneself from epidemics. Which help in living a full life physically, mentally and socially. To get rid of the disease, everyone needs to develop the habit of mind culture. Happiness is a state of mind that helps us make a positive change in our attitude towards others and life. We firmly believe that in the near future ... "One day the storm will stop, the world will calm down again ".

Keywords: COVID-19, Ayurveda, Yoga.

1. Introduction:

Health and healthy body are at the root of reaching the limitless goal of life. Illness and unhealthy are the main causes of failure in life struggle. Life is a combination of body, feeling mind and soul .All the matter present in the universe is the sum of five special elements, such as the earth, climate and other space. These elements are present in our body in different levels according to the structure of the body and the needs of different organs. These nutrients are also present in the food that we take for the growth of the body. Which is digested by the body with the help of five and provides physical development to the body. The health and well being of the human body depends entirely on the balance and physical condition of the elements present in the body. This necessary balance can vary due to various internal or external causes of the body which can lead to illness.

2. Awareness:

Sariram-Baydhi -Mondiram .The human body is the only source of disease. Human beings only violate the rules of health protection.

Human beings have to live their lives by enduring the season and nature through various disasters. At the root are the effects of air, bile and phlegm. Each pathogen has five levels, namely, prognosis, diagnosis, form, appendage and completion. The cause of the disease is called diagnosis. Some of the symptoms of the disease are manifested before the disease. In case of disease the name of the symptom by which the nature of the disease is known. The one who cures the disease is called Upasaya. The recent description of the way in which air is irritated and produces disease is called recent. It is possible to bring healing by purifying the inside and outside of the body. It is always one's duty to keep the mind free from the desire for unhealthy things.

Epilepsy is one of the most common viral disease worldwide. Nature creates virus epidemics every hundred years in an effort to maintain balance as a result, the human race is afflicted with various deadly disease and falls prey to destruction. The global epidemic Corona virus indicates an ongoing phenomenon worldwide. The first virus infection occurred on December 1, 2019 in Wuhan, Hubei province, China. The virus evolved and transmitted to humans through animals. According to the source, the first person to be infected with the Corona virus in China was a 55 year old man on November 17. January 7, 2020 it was announced as a new type of Corona virus, and distributes genetic information to scientists worldwide and to relevant authorities. January 30 (WHO) declares the outbreak an international public health emergency. On March 11, 2020 the world health organization recognized the disease as a global epidemic.

Corona virus is a large family of many similar viruses that infect animals, and humans. The invisible killer is the Corona virus, which has rapidly stunted the progress of science and human arrogance and it is unimaginable that the lamp of human dignity has burst. Naturally death is now breathing down the necks of the victims. Everywhere in the world, bodies are not buried with honor in graves or crematoriums, which is dreary to the human race. Nature is quietly satisfying her vengeful desire and is rapidly returning to normal with her colorful barandala. Biodiversity is getting rid of noise and

pollution, river are enjoying the taste of liberation with some pride. The water of the Ganges is becoming more and more sacred. In all countries of the world, the first and second stage of the Corona infection cannot be prevented, so today the corona has become epidemic. As in the case of the Chinese doctor 'Lee' he was boycotted after he alerted the government in November 2019 about the devastation of the Corona, causing the infection to spread rapidly.

In the self-imposed lockdown the sound of despair is heard all over the world. Today animals are under house arrest, without restraint and wild animals are living in the joy of creation. The negative effects of Corona have brought about immense change in human civilization. Nature is the mouth piece of birds today. It proves that the world will be habitable for future generations if we give up the pursuit of self-control and domination over nature. Nature will be able to take care of itself if it becomes environment friendly without issuing suicidal fatwa on nature. Nature warned us again that we were busy depriving nature of its symbolic beauty.

Indian civilization when contradicted nature. Starting from Atharvaveda, Charaksanghita, and Sushrutasanghita etc. Virus disease, there symptoms and treatment systems are mentioned and treatment system are mentioned in eight sections. Charaksanghita is a large and informative book of medical texts. Which is vast as the Himalayas and as deep as the ocean, not only in the form of medical texts, Charaksanghita is treasure trove of all kinds of knowledge and a remarkable text for the complete practice of Ayurveda, so from the Vedic age to modern times it holds the Indian wonder which is our proud heritage. According to Manusanghita - **अनादृशः खानि न स्पृशेदनिमित्ततः** without any specific reason we should not touch our eyes, nose, ears, mouth etc., especially on sensitive organs. In this contest, Padma Puran also interprets that - **"हस्तपादे मुखे चैव पंचोन्दे भोजनं चरेत्"** means we should wash our hands, mouth and legs before taking the meal or touching the face. In Markendeya Puran, clearly mentioned that cleaning of own clothes after immediate use, as a result we can stop the spreading of virus one place to another of virus in washing with detergent.

3. Conclusion:

In Ayurveda, the diagnosis is made only after judging the complete physical and mental condition of the patient. Physical ailments can be cured through herbs, mental ailments are not possible, therefore, in order to get rid of the disease in the human world, four purification are required - Stourja, patience, goodness and purification of the mind. By mindfulness the body is a perfect communication between the mind and human nature. Since the beginning of civilization, various Yoga asanas have been successfully applied in curing physical and mental ailments. The main purpose of Yoga is to live with freedom in all aspects of life, health and harmony. By Yoga the human sphere is reunited with the soul. Yoga and meditation, mindfulness are requested to get rid of the current COVID- 19. Which helps to keep oneself physically able and mentally alert and emotionally balanced. The truth of Good and man is self-truth and we have to use our consciousness to keep this truth a live. The luxury and comfort of modern society gives us all the benefits that make our minds soft and weak, so regular Yoga, meditation for the power of God is necessary to strengthen ourselves physically and mentally. We are convinced that in the near future, the tide will come again in our dead Ganges.COVID-19 in treatment - “India will again take the best seat in the world meeting “.

COVID -19 and Impacts on Daily Life

Suvasish Roy

ABSTRACT

Epidemic has come every century but the pandemic like covid-19 has first time in the world. The whole world scared due to highly Contagious. This disease can't discriminate between poor and rich then also why poor are suffering every time during this situation? We all have our capability to fight against the odd of our life as well as to manage survival goods. We should gratitude to nature because nature is always showering her blessing on us equally but it's the human creature who discriminate between poor and rich as well as between flora and fauna. Rich and selfish giant like people get the maximum facilities of nature, science and technology and isolate the others.

Key words: *Epidemic, Pandemic, Contagious, Social distance, lockdown, Flora and Fauna, Discrimination.*

1. Introduction:

Every century world has experienced epidemic like plague, Spanish flu and many more things, this the first time that the whole world is suffering a highly contagious disease. Yes you are right I'm telling about COVID-19. We all know about this viral disease little or more or nothing about it.

As it's a highly contagious and invisible and the most important part is that still now the vaccine is not invented so the only solution is to maintain social distance. Now just think about it in cool mind

that, how much it's possible to maintain social distance for rich, middle and lower class people? (Especially daily labour).

Every family every person have their own capability to storage daily needs. If you have the capacity to store one year , I've only one month, someone have one day and some daily labours don't have capacity even one day whereas few people of our country have the capability for many generation.

So it's clear that any how daily labour section must will die either in disease or in scarcity of food.

2. Impact:

The COVID -19 is a global spanning health and socio-economic crisis. Its impact can be seen directly at the local level. Including news our country has experienced of discrimination, hunger and poverty and so on. On the other hand, we also saw the blessed side of many institutes, firms and individuals persons who have appeared as an angel to those in need. It shows that, this is also led to many of us probing the socio-economic structure we have embraced.

The last half century before COVID-19 can be marked by a vast technological changes. Smart phones including all social media and a great development of communication system, planes connected the people across the world, and it's made our earth very small, banking and entertainment were merely a click away. In spite of all those things technology's true potential and blessed could not reach to the lives of the world's poor- to be more than just entertainment or convenience-was unleashed in the aftermath of the virus.

We can see that where the rich ,upper middle class and above benefited from technology in all aspects of their lives , they controlled the nature also, they dominated and others were dominated the experience was not similar for Ramu kaka who growing crops and vegetables and rice for the town. It is same for Gita didi who is a pregnant woman from a poor family in accessing healthcare for her child even far away from the modern treatment.

While some young organizations were attempting to bridge these gaps, they were not yet mainstream solution back in 2020. Now we can say that some social media like Whatsapp and Facebook,

YouTube are now reached maximum numbers of people even those don't have toilet in their house, then also some others products like soaps, toothpaste etc., which had reached the world's poorest, but still goods, services and many advanced technologies, treatments that shrunk economic and social divides were far and few in between.

I always think that how you saved the door every day to protect your parents, grandparents, relatives and other family members from corona virus. Unfortunately, not too many of the elderly had the fortune of a doting grandson like yourself, and many struggle to manage their health admits all the lockdowns.

As we know that the vaccine of COVID-19 yet to develop so other than only one important protection from COVID-19 is people will stay at home, called quarantine, there was less travel meant maintaining social distance and less air pollution.

Now I'm not saying a pandemic was the solution we wanted to our complex environmental challenges. Not immediately but it is sure that corona virus knocked in our mind as a grim reminder about how humans do such things as a superior creature of god, for thousands of years human exploited natural resources as well as human harms every living species worked as a pollutant.

It remind us that not only do humans not own the planet, that we share it equally with fellow human beings. Our life is about respectful cohabitation, and unless we learned to coexist, nature would find extreme ways to reclaim its space.

Surely, we are blessed an extraordinary power to realised and to overcoming the crisis and as we had done earlier we can now also to rebuilt and reshaping the world for the better, and I wish for you and the next generation that will come after a same realisation as you navigate your ship of life through your productive, beautiful ,better than the best interconnected orchestra of life, the planet will be shared equally by humans, and tiny bacteria to gigantic animals ,birds - "Vasudhaiva Kutumbakam" or the whole world will be a family under a single roof.

3. Conclusion:

So it's clear that covid-19 may or may not man made but it's clear that last five decades human civilization has made the situation. We only responsible for this danger. It's a great opportunity for us to realise our responsibility towards the human civilization as well as the other creatures. If we fail to do this the nature is enough to rectify itself without our help.

E-Learning During Pandemic Period

Mousumi Pal

ABSTRACT

School are closed all over the world due to COVID-19 pandemic. Approximately 1.2 billion students cannot go to school. And as a result of pandemic total education system is changed. Now the only way of teaching is digital platform. Various digital platform, mobile application now used for teaching and learning. But there are too many challenges in e-learning system. In e-learning system there is no face to face interaction. Many poor people living in India can't buy smartphone or laptop which is essential for the e-learning and digital teaching. And large part of the country especially village and mountain are not connected to Internet. Govt. should develop a proper internet network for the student and give student free smartphone or laptop.

1. Introduction:

The COVID-19 pandemic has disrupted the whole world. Governments have imposed severe lockdown. This has led to closing of educational institute like schools, college and university. However, to ensure that students do not miss out on their studies, education has moved online. Different types of e- learning methods are being used. Whatsapp, YouTube, Google Meet have become part and parcel in the lives of students and teachers.

Assessment of the situation:

With the arrival of COVID-19, e- learning seems to be one of the safest and easiest ways to impact education, E-learning is now relevant not only to learn education but also to manage extra – curricular activities for pupil, informative online sessions, online conferences and webinars. The demand for e-learning has jump up significantly and will continue to do so as the society is adapting to social distancing.

2. Benefits:

E-learning offers a very systematic way to deliver lessons. Use of Videos, sharing of resource, study material, serving assessment tests can all be done online. Additionally, the lectures can be recorded, giving an opportunity to reach a wide range are less chances of students missing out on classes as they can access it any time from the comfort of their home.

3. Challenges:

E-learning is not free from its challenges. While it is a privilege for the students from an upper class and middle class, it has proved to be a nuisance for students belonging to the lower middle class, poor as well as below the poverty line. It is true that internet penetration has grown significantly over the past few years in India. Still a large part of the country is not connected to internet. Again, there is an issue of data connectivity fluctuation in the internet speed resulting in the discontinuity of learning of students. Human beings learn a lot by simply being around other human beings. Sadly, e-learning takes away all physical interactions that students and teachers might have on the school campus. It's always good for students to be around other students to talk of discuss ideas, which is an essential part of learning. Therefore, peer learning certainly takes a hit. E- Learning also brings health hazards to teachers and students; continuous staring at a screen can have a harmful effect on the eyes.

4. Suggestions:

In order to overcome the challenges of e- learning certain steps must be taken. The first and foremost task should be to develop a proper internet in fracture without which inclusive online education

is impossible. The definition of the Right to education needs to expand and promote online education so that it address the importance of association and access to knowledge and information. Teachers should have a structured plan which does not suffocate or burden them and also need the students involved. Again, this is the right time for deep reflection on curriculum, keeping in mind the present day scenario.

5. Conclusions:

In the concluding lines, it can be said that the pandemic has transformed the century's old, chalk- talk teaching model to one driven by technology. While all modes of learning have their benefits and drawbacks, after the current crisis, it is clear that some form of blended learning will evolve with E-learning forming a crucial part of the overall teaching – learning process.

Monetary and Social Sway of COVID-19 and Resilience

Mrityunjoy Mahata

ABSTRACT

Strategy questions are frequently encircled in mainstream conversation as circumstances where pulling the correct switches will get the economy and society in the groove again delayed repercussions and emergencies. This methodology disregards how frameworks interface and how their foundational properties shape financial results, prompting an over-accentuation on a restricted arrangement of attributes, quite effectiveness. We contend that this accentuation on productivity in the activity, the executives and results of different financial and social frameworks is definitely not a cognizant aggregate decision, yet rather the reaction of the entire framework to the impetuses that singular parts face. This has carried a significant part of the world to depend upon complex, settled, and interconnected frameworks to convey products and ventures far and wide. While this methodology has numerous advantages, the COVID-19 emergency shows how it has likewise decreased the strength of key frameworks to stuns, and permitted disappointments to course from one framework to other people. This paper surveys the effect of COVID-19 on financial frameworks, examines the thought of versatility, and gives explicit suggestions on both coordinating flexibility investigation for recuperation from the current emergency just as on building strong foundation to address future fundamental difficulties.

Keywords: COVID-19, Coronavirus, Resilience, Economic effect, Risk

1. Introduction:

Proclaimed a pandemic by the World Health Organization (WHO) on March 11, 2020, COVID-19 immediately spread internationally. The older disproportionality experience more negative wellbeing results, yet the impacts on them result from something other than the ailments basic to other in danger gatherings, for example, heftiness, smoking, coronary illness, and diabetes. Some of extra factors add to the all out effect. The old are outstandingly presented to death from the infection, yet additionally chances emerging from confinement and powerless social ties, exacerbated by the discontinuity of wellbeing and social consideration administrations. School terminations are the principle sway on youngsters and youngsters, yet the ability to make up for the anticipated misfortune in learning changes as indicated by financial status, with those from low-salary as well as single-parent families liable to be the most influenced by the conclusion of schools and childcare offices. The PISA 2015 studies (OECD 2016) uncover that almost a fourth of 15-year-olds of low financial status don't have an office or a tranquil spot to consider; a little more than 1 of every 5 young people in similar families have no entrance to a PC for school work or a web association. The most unfortunate youngsters are likewise enduring by being denied of school dinners and other help measures gave by or at schools. The varying social effects are one consequence of various financial patterns that have just been molding prosperity for a long time before the COVID-19 pandemic, quite the effects of starkness, developing disparity, debilitated social assurance, and expanded trickiness in labor markets (OECD 2011, 2018). The OECD Interim Economic Outlook, delivered on March 2, 2020, shows how limitations on the development of individuals, products, and administrations, in mix with regulation estimates, for example, business terminations, have cut assembling and local interest pointedly in China, while likewise influencing the remainder of the world through business travel and the travel industry, worldwide gracefully chains, items, and loss of certainty. The underlying direct effect of the shutdowns could be a decrease in the degree of yield of between one-fifth to one-quarter in numerous economies, with purchaser consumption conceivably dropping by around 33%. This

is far more noteworthy than anything encountered during the 2008 money related emergency. Also, this gauge just covers the underlying direct effect in the parts in question and doesn't consider any extra circuitous effects that may emerge. Regardless, unmistakably the effect of the shutdowns forced on numerous economies will debilitate momentary development prospects significantly, comparable to a decrease in yearly GDP development of up to 2 rate focuses for every month that exacting regulation measures are forced. On the off chance that the shutdown proceeded with continuous for 3 months, with no counterbalancing factors, yearly GDP development could be somewhere in the range of 4 and 6 rate focuses lower than it in any case may have been. Notwithstanding, the most noticeably terrible potential effects might be balanced by measures, for example, the USD\$5 trillion in monetary spending the G20 nations consented to infuse into the worldwide economy at their highest point on March 26, 2020.

The COVID-19 plague and measures to check it are probably going to disproportionally influence less fortunate individuals. The OECD's "The manner by which's Life?" 2020 shows that in general, 36% of individuals in OECD nations are monetarily helpless, which means they would do not have the money related resources expected to abstain from falling into neediness if they somehow happened to lose 3 months of their pay. This figure moves to over 60% in some OECD nations. Those working in the "gig economy" are the most uncovered. These laborers regularly take a shot at short agreements, some of the time with powerless or no social insurances, with constrained alternatives for working distantly, and with dangers of occupation misfortune and done without income in the event that they need to stay away from their work environment because of disease, isolate, or government-ordered terminations of explicit exercises. Hostile to infection estimates will influence them altogether since they are frequently utilized in occupations requesting a serious extent of contact with a wide scope of customers, for example, cafés, taxicabs, and conveyance administrations. Measures to repay individuals and firms for lost profit are being acquainted with lighten the circumstance. These can incorporate deferment of expenses and

obligation reimbursements and government paid leave for individuals in nations which don't have paid wiped out leave. Be that as it may, in nations where there are momentary agreements, and less fortunate individuals have hardly any investment funds, no measure of money related upgrade will re-invigorate request. Poor people will be hardest hit in nations, for example, Indonesia, Mexico, and Brazil, with up to half or higher of the populace utilized in the casual division and not many channels through which any guide could contact such individuals. Oxfam gauges that the financial emergency brought about by COVID-19 could drive a large portion of a billion people into destitution (Oxfam 2020). In any case, restrictive money moves were scaled up viably following the 2008 worldwide budgetary emergency; even in the Least Developed Countries, nourishment for work programs and different types of social security can give some help. With regards to the gracefully side of the economy, firms that have needed to diminish their exercises will set aside effort to restart creation and to add to worldwide flexibly chains. In the more drawn out term, two effects could be particularly genuine. The first is the effect on worldwide relations and the vectors of globalization. The COVID-19 pandemic has helped us obtusely to remember the delicacy of a portion of our most essential human-made frameworks. Deficiencies of covers, tests, ventilators, and other basic things have left bleeding edge laborers and everyone perilously presented to the malady itself. At a more extensive level, we have seen the falling breakdown of whole creation, money related, and transportation frameworks, because of an awful mix of flexibly and request stuns. China's product exchange was down 17% in the main 2 months of the year. While exchange may bounce back when the circumstance improves, there might be longer term, auxiliary impacts: firms may withdraw from globalization, looking for abbreviated flexibly chains and providers situated in nations that appear to be less inclined to disturbance. This would have ramifications for creation structures, occupations, and pay in various pieces of the world. This is stressing when worldwide participation is actually fundamental in organizing the reaction to COVID-19 and future foundational dangers. Shockingly, the systems that may give a planned worldwide reaction

don't exist, with the exception of constrained money related courses of action. The universal monetary framework is as of now observing the effects of COVID-19, with expanded unpredictability and sharp drops in share costs. In the event that these falls are the start of a more drawn out descending pattern, there will be an immediate negative riches sway on resource holders. This may influence financed annuities and retired people's expectations for everyday comforts. Further facilitating of money related approaches by national banks (particularly by the European Central Bank where store rates are as of now negative) may fortify the salary impact for retired people or push savers to higher-hazard ventures. Then again, low loan fees may additionally fuel swelling in resources that are viewed as places of refuge (e.g., land, gold, government bonds) aggravating disparities in riches. By and by, the shadow of 2008 falls over the viewpoint today. The IMF's Global Debt Database shows that absolute worldwide obligation (open in addition to private) came to USD\$188 trillion toward the finish of 2018, up by USD\$3 trillion contrasted with 2017 (and up by over USD\$90 trillion from 2007). The worldwide normal obligation to-GDP proportion (weighted by every nation's GDP) edged up to 226% in 2018, 1½ rate focuses over the earlier year (IMF 2020). In spite of endeavors to decrease monetary shortages, numerous legislatures despite everything have elevated levels of obligation following their mediations to manage the money related emergency and its result, and sovereign spreads for certain nations are beginning to augment. Private obligation, energized by low financing costs, is considerably additionally stressing. In cutting edge economies, IMF information show that the corporate obligation proportion has continuously expanded since 2010 and it is currently at a similar level as in 2008, the past pinnacle. In a few significant economies obligation is, or was, progressively utilized for budgetary hazard taking (to finance appropriation of profits, share buybacks, and mergers and acquisitions). A significant part of the obligation is high theoretical evaluation obligation, and a huge division of corporate obligation is presently appraised BBB, the most reduced speculation grade rating. Practically 50% of all US corporate securities developing in the following 5 years are

underneath venture grade. Worldwide family unit obligation is over USD\$47 trillion, contrasted with USD\$35 trillion going into the 2008 emergency.

2. Systems and policies to increase versatility:

All in all, by what method would it be a good idea for us to manage the impressive stun that COVID-19 spots upon worldwide markets, general wellbeing, social action, and administration? How might we address the intellectual and particularly conduct impacts of dread at the individual and aggregate level which can trigger considerable log jams in monetary movement, just as the fundamental impacts that strain different segments of worldwide exchange and administration? Two overall ways of thinking and procedures are accessible for partners to draw upon. As of not long ago, the accord would have demanded keeping a danger from occurring in any case or, if total anticipation or shirking were outlandish, upon considerably moderating the results of the danger. As the premise of regular hazard the board (i.e., to get ready for and ingest stuns), this alternative is politically engaging at the beginning, as it offers the likelihood that unsatisfactory dangers might be moderated before they cause significant problems(1). In a universe of quick input circles and progressively settled frameworks where falling disappointments are unavoidable, in any case, such choices may be incapable at ensuring monetary and social frameworks and quieting annoyances, or would be ruinously costly to actualize to the degree expected to guarantee policymakers and different partners of satisfactory assurance (Michel-Kerjan 2012; Linkov et al. 2019). The subsequent methodology is one that acknowledges the intrinsically unsure, eccentric, and even arbitrary nature of foundational dangers and addresses them through structure framework strength. As opposed to depend entirely upon the capacity of framework administrators to forestall, dodge, withstand, and assimilate any dangers, versatility stresses the significance of recuperation and transformation in the result of disturbance. Such an outlook recognizes, that the unbounded universe of future dangers can't be satisfactorily anticipated and estimated, nor can the impacts thereof be completely comprehended. Versatility recognizes that enormous interruptions can and will occur—later on,

for instance, atmosphere disturbance will probably compound different stuns like pandemics—and it is fundamental that center frameworks have the limit with regards to recuperation and transformation to guarantee their endurance into the future, and even make the most of new or uncovered open doors following the emergencies to improve the framework through more extensive foundational changes(2). This is once in a while described as bobbing back, however “ricocheting forward” (Linkov et al. 2018a, b; Ganin et al. 2016, 2017). COVID-19 is the most recent occurrence of an erratic stun to interconnected frameworks, where global recuperation will have tremendous ramifications for future monetary, social, and legislative action. Versatility must turn into a center way of thinking inside framework the board and activity to guarantee we can keep on working in spite of interruptions like COVID-19, and are capable not exclusively to adjust and improve in its result, yet to take advantage of new or uncovered opportunities (3). Interconnectivity between frameworks is one of the organizing and deciding highlights of our cutting edge world, which is getting always intricate and dynamic. This is a result of monetary open door just as worldwide political interconnectedness, and has carried significant advantages to a great part of the worldwide populace. An intuitive response to the COVID-19 episode is confine or diminish such interconnectedness, yet such clearing strategy changes would worse ensure nations or worldwide markets against future foundational dangers. Rather, an accentuation after creating versatility inside the worldwide financial framework is an important development for a post-COVID-19 world, where frameworks are intended to encourage recuperation and transformation in the fallout of disturbance. Supplementing hazard based methodologies with resiliencebased approaches for the executives of scourges, just as for other foundational dangers, is a need. The strength we are discussing here, in any case, isn’t flexibility in the conventional sense, which means the ability to oppose downturns and return to a similar circumstance as in the past. There is a mindfulness that the foundational dangers present day social orders face are progressively hard to display, and are frequently too complex to be in any way understood for the “ideal reaction” utilizing customary methodologies of hazard evaluation that

concentrate essentially upon framework hardness and capacity to ingest dangers before breaking. The new way to deal with strength will concentrate on the capacity of a framework to foresee, retain, recoup from, and adjust to a wide cluster of fundamental dangers. Linkov et al. (2019) recognize foundational dangers and audit the expository and administration approaches and techniques to deal with these dangers (counting pestilences) and construct strength to contain their effects. This means to assist policymakers with building protections, supports and at last strength to physical, financial, social and natural stuns. Essentially, COVID-19 is a multi-framework issue. Starting with a moderate yet unchecked spread of infection on a worldwide scale, it immediately disturbed emergency clinic frameworks and related asset and work prerequisites. At the same time, as financial movement disappeared per government orders for isolate and cover set up, fundamental interruption spread past the general wellbeing area and into vitality (petroleum derivatives), financial aspects and money, and even the more extensive political frameworks of different states. The loss of usefulness set off by this single interruption birthplace is one that requires powerful recuperation to limit broad and even perpetual multisystem misfortunes and harms— an exercise gained from the consequence of the Great Recession.

3. Conclusion:

Financial investigation is regularly the most significant instrument for policymaking, however given that the financial framework is changing and self-sorting out itself in a manner which is troublesome, if certainly feasible, to accommodate with existing hypothesis, financial aspects needs to change as well. In an undeniably intricate and reliant framework, the total marvels that rise do as such as an impression of the association between all the members. The framework is continually developing and is neither in, nor joining toward, a consistent state. Strategy can't be founded on extrapolations from an earlier time or investigation of the conduct of a detached person. Framework examination models need to improve as well, to all the more likely coordinate genuine elements, for example, social and conduct heterogeneity. This will assist with

speaking to social elements and complex aggregate dynamic and encourage the assessment of the viability of arrangements and their foundational impacts. A promising methodology is to incorporate existing demonstrating instruments from various fields, for instance connecting ecological models with financial development and exchange models. This expands the limits of what is displayed and takes into consideration more extensive scopes of co-operations to survey strategy mediations. Going past the combination of existing instruments may include spearheading applications and inventive strategies and devices in a few territories, including express representing vulnerability, different specialists with key associations, limited levelheadedness, including utilization inclinations and shopper decisions, and system impacts connected to complex interconnectedness and fundamental dangers. A crucial test to administering foundational chance is understanding the framework as a perplexing system of individual and institutional entertainers with various and regularly clashing interests, values, and perspectives. Superimposed on this administration arrange are the potential hazard occasions with not well characterized chains or systems of interrelated results and effects. A versatility mentality recognizes that the endless assortment of future dangers can't be satisfactorily anticipated and estimated, nor can their belongings be completely comprehended. Embracing such a methodology implies reexamining our needs, and particularly the jobs of advancement and proficiency. The study of frameworks building instructs us that when you attempt to upgrade one piece of an unpredictable framework, you can wind up destabilizing the framework all in all. This standard is apparent in worldwide flexibly chains, without a doubt one of the most productive segments of the global economy. The French Minister for the Economy, Bruno Le Maire, contends that that there will be a when COVID-19 for the world financial framework: "We have to make all the inferences from this plague in transit globalization is sorted out, and outstandingly esteem chains" (Le Maire 2020). At the point when your profoundly enhanced work process is disturbed by stuns, for example, COVID-19, perhaps in the nick of time needs a portion of in the event of some unforeseen issue.

In 2015, Bill Gates said, “We are not prepared for the next outbreak,” and suggested creating an army of specialists from many disciplines to meet whatever crisis or epidemic might arise. 27 million people viewed the talk in which he made this comment, but as he noted in 2020, nobody in power heard the message. We are now in the midst of a systemic upheaval. In the spirit of Gates’ call, international policy making should look to better anticipate, prepare for, and build resilience for future crises.

The extreme vulnerability related with complex frameworks makes it difficult to foresee where the following emergency will originate from; all things considered, this ought not to stop us learning the exercises of the past to set up a foundational reaction for what’s to come. One exercise from COVID-19 is that emergencies don’t rehash themselves. The way that we had the option to contain past coronavirus emergencies, for example, SARS prompted a feeling of lack of concern in certain cases about our capacity to contain any future emergency. We can’t bear to be self-satisfied about the other grave emergency we are confronting: the atmosphere crisis. In foundational terms, this isn’t a stun, with all that infers of an abrupt, startling event, however more like a pressure. Frameworks examination instructs us that anxieties, for example, a worldwide temperature alteration are non-direct. The framework may keep on working pretty much ordinarily for an extensive stretch and just corrupt gradually, however it would then be able to arrive at a tipping point from which it can’t recuperate, and breakdown would then be able to be incredibly quick. Covid19 shows that we need to act now, since we just don’t have the foggiest idea how changes in a single framework may develop and affect different frameworks, or for this situation how a transformation in an infection could handicap the world economy. We can envision, in any case, that genuine harm to a characteristic framework, for example, biodiversity misfortune, or huge changes, for example, ocean level ascent or expanded event of extraordinary climate, will impactsly affect monetary and social frameworks as well. Further, as we recoup and reconfigure frameworks for a more promising time to come, we should be mindful of the way that future foundational stuns may emerge from any

number of starting points or enterprises, with no sensible method to envision and get ready for the wide universe of dangers. Rather, our frameworks must be intended for versatility, giving them the limit with respect to recuperation and transformation paying little heed to the difficulties they may confront.

1. This isn't to limit the significance of hazard the board. A more grounded chance methodology would, for instance, have prompted total improvement of a SARS immunization, in light of the fact that a coronavirus episode or something to that affect was likely eventually, and the expenses of finish would have been paltry in correlation.
2. For model, the defensive capacity of cradles, the mental and authoritative elements of slack (see Shafir and Mullainathan), or the versatile capacity of repetition by structure (there are numerous instances of this in science and building).
3. For example, under the French G20 Presidency, and with respect to an overall food esteem crisis (that saw the expense of a noteworthy number of the huge food products twofold), the UN Food and Agriculture Organization (FAO) and the OECD drove a get-together of ten IOs to propose creation of an Agriculture Market Information System (AMIS). This proposition was settled upon by pioneers, thus executed, and has been working for practically 10 years. This structure joins exhibit expertise (by and large from FAO) and methodology data (generally from OECD), a Market Information Group (country delegates, instructed to ensure fortunate exchange of market encounters), and a Rapid Response Forum (senior country specialists, reinforced by IOs, depended with watching out for emergency conditions constantly – to avoid a crisis, or if nothing else moderate its reality). AMIS showed its motivating force by dismissing a nearby crisis in its first year of action, and is dynamic starting at now checking markets and approaches, and interfacing with countries to support taught dynamic and avoiding of horrendous course of action choices.

Effect of COVID-19 on the Livelihood of Common People in India

Ritu Jana

ABSTRACT

At present the greatest threat, not only in India but also in the whole World, is COVID 19. As conscious citizens we have the responsibility to make people aware about the destructive impact of COVID 19 and to guide them in proper way how to fight against COVID 19.

Present situation leaves a very crucial effect on the livelihood of common people. The people, whose livelihood depends on daily wages, are the worst suffers for their uncertainty of income, they are compelled to commit suicide or welcome death with hunger.

The lack of medical facilities, the condition of state-run hospitals put India into shame. But from past India overcomes too many obstacles and has made significant achievements. So we have to spread our hands on both –relief and rehabilitation measures to help and aware the affected people.

Keywords: COVID 19 , Crisis, Income, Health.

1. INTRODUCTION:

The COVID 19 pandemic is one of the greatest threat not only in India but also in the whole world. The only way to control and overcome this fatal pandemic is to make people aware about the destructive quality of COVID 19 and also to guide them to avoid social contact and to restrain themselves from moving outside.

2. THE HISTORY OF PREVIOUS PANDEMICS:

The present pandemic situation of India is leaving a crucial effect on its population and also on the livelihood of common people. The COVID 19 is not the first one from which India suffers. After our independence, we still call up the threat of SMALLPOX in 1974, the GASTRO-ANTRIC outbreak and so on. In the past too, pandemics ravaged our country. We read about the MALERIA epidemic that ravaged the life. But India has made significant achievements since its independence within its various obstacles.

3. THE EFFECT OF LOCKDOWN:

Amidst the shutdown, though the urban citizens stood up to monitor neighbors and surroundings, middle class donated generously towards the newly created P.M Fund, C.M Fund but the worst outcome was faced by the rural or common people who had arrived at the more industrialized and affluent parts of the country to toil as laborers, receiving uncertain and irregular incomes and living in extremely poor condition. When Indian Railways announced stopping of Trains, millions of rural workers began their uncertain wait and faced a rough livelihood. These people now found themselves as helpless animal, trapping in a cage.

Common people who depends on their daily wages felt themselves helpless. Neither they earn to maintain livelihood nor do they help their near or dear ones. This situation compelled them to commit suicide. On the other hand some welcome their deaths with hunger and utter exhaustion.

These images of the whole country will leave a psychological impact not only the whole world but also the younger ones in India, who had not ever experienced such inhumane treatment of the poor, such chaos and hunger.

4. SHAMEFUL PLIGHT OF INDIA'S HEALTH UNIT:

The 2020 pandemic situation showed to us the shameful plight of India's health unit. According to WHO, India provides 7.6 doctors per 10000 people. The conditions of State-run hospitals is pathetic and it puts India to shame.

5. STRUCTURAL CHALLENGES TO POLICY MAKERS:

In this crucial situation, India ignored a very large section of its population. Without adequate social and economic protection measures, the states failed to look after its own common people. Their condition has now exposed the pathetic way of deep poverty and helplessness of workers. The sad news behind our economic growth and revealed the structural challenges to policy makers.

6. CONCLUSION:

It is clear that the informal sector of the economy that sustains the livelihood of India's common people who needs some more policy attention: The unhygienic working and living condition of millions, the mobile nature of most of the workforce and so on

Going forward, one can face to face many challenges as farmers and farm laborers set out to rebuild their lives and livelihoods? Migrant laborers who are succeed to return will not be able to return their job immediately. On the other hand some may not wish to return. In this situation we as a conscious citizens have to spread our hands because there is need of both relief and rehabilitation measures to help the affected. Precautionary measures like: Maintaining social distancing, use of hand wash, hand sanitizers, masks using and so on.

How Can We Make a Living by Keeping COVID -19?

Amit Mondal

ABSTRACT

Another name for panic is the Corona virus. Humans are carriers of the Corona virus. The Corona virus is spreading through human contact origin of infection from fish and from fish market. Corona common respiratory virus infection. It usually takes five days for the symptoms to appear. The world health organization says the virus has a hankering period of to 14 days. This is because in visitors fear that the 2019 Novel Corona virus could change the behavior of leaders. The government will take care of the situation government sources said. In the last five years alone there has been an outbreak of another type of Corona virus, called Zika, mass in the world.

Keywords: *Virus, Originated, Economy, Antidote.*

1. Introduction:

Corona virus is a virus that spreads from one person to another in a panic. Germs are spreading with human. But what is the Corona virus. Another name for panic is the Corona virus. Humans are carriers of the Corona virus. The Corona virus is spreading through human contact. After a long examination, which was confirmed by Chinese doctors. Hearing that, the anxiety is increasing several times. Not only China but also India and the United States are in a state of panic. Silently the disease has taken root in the body. When the Corona virus is caught you will be on the verge of death. All countries are working hard to prevent the deadly disease. Corona virus is an infected virus that has never spread to human's before. The virus has claimed six lives worldwide. The number of infected people worldwide stands at 14 million date as of July 18, 2020. Another name

for the virus is 2019n-cov or novel Corona virus. There are many species of Corona virus. But there are six species in the human body. But that number is due to a new type of virus. SARS has been rampant in China since 2002. (Full name is severe acute respiratory syndrome). The virus that killed 774 people worldwide and infected 8098 people with a type of Corona virus. The new disease has been called in many ways in the beginning. Such as China virus, Corona virus, new virus, mystery virus. In the second week of February this year COVID-19 gave the official name to the world health Disease.

2. Some points about the corona virus:

- ❖ Origin of infection from fish and from fish market.
- ❖ Corona common respiratory virus infection.
- ❖ Antibiotics do not work against the virus.
- ❖ Fear of Sangha from animal fur and feces.
- ❖ News from Chinas one province is first available.
- ❖ The virus is actually like the common hanfaruna.

3. How this virus originated:

Corona common respiratory virus infection. The Corona virus is transmitted primarily from the animal Corolla nature virus. It is seen that the origin of contraction is from fish and fish market. How people with viral infection get colds, coughs and fevers can also be infected with the virus. This courses pneumonia and more severe shortness of breath. Even water accumulates in the human body and in the body of animals. Corona virus can be spread by sneezing or coughing. The Corona virus can spread from person to person, even from a distance such as talking and shaking hands .There is a risk of infection if the Corona virus related glasses are used by other people. From a patient on dialysis to a person suffering from cancer or kidney disease the virus can easily spread from death to death. The Corona virus is thought to have spread wild life market. Chinese doctors or would health organizations are new investigating to determine exactly how the virus was transmitted. Corona virus in not a single virus but a group of viruses that spread multiple diseases in human. From the simplest century to the most complex almost fatal sarcomeres. The name of the virus is derived from the size of the crow that extends from the center of the time.

4. What are the symptoms of the disease?

- ❖ In addition to respiratory rancidity fever cough and respiratory problems are the main problems.
- ❖ If irritates the lungs.
- ❖ Dry cough usually starts with fever.

If usually takes five days for the symptoms to appear. The world health organization says the virus has a hankering period of to 14 days. However according to some researchers if can last up to 24 days. When people show symptoms of virus, they are more likely to infect people. However it is now thought that the virus can infect health people when they are not sick. In the early stages of the disease it is common for people to be reluctant to eat because of the disease which is similar to cough and fever. The outbreak of the Corona virus has reminded many of the Sara virus. It killed 774 people in many Asian countries in earth 2000. Analysis of the genetic dude of the new virus has shown that if is very similar to the TSAR virus. When we see a new Corona virus we want to know how serious its symptoms are. This virus is a lot like the flu but not more deadly than the SARA.

5. What is the impact of this virus on the economy?

Shares in China and Hong Kong have plummeted as news of the Corona virus spread .This is because invisitors fear that the 2019 Nobel Corona virus could change the behavior of leaders. If the world declares a state of emergency on the basis of this virus. However the investment market may fall further. Especially travel entertainment and guest service. Anurag Thakur told reporters at the parliament house premises. A study is under way on the impact of Corona on the country's economy. The government will take care of the situation government sources said. The prime Minister has already directed the finance ministry policy commission to conduct a study on the Corona impact of its economy advisers. But economists gave their opinion that the Corona parity has begun to take root in the country's economy. The rote of economic growth can be reduced to one percent. Tax collection will be greatly reduced.

6. Antidote to Corona virus:

Thousands of people have been infected with the deadly Corona virus in many countries including India and there is no path of cure for the disease till now. In the last five years alone there has been an outbreak of another type of Corona virus, called Zika, MERS, in the world. Now the virus called 2019-nCoV has spread all over the world. The virus has already infected thousands of people. It turns out that it took scientists a few years to develop an Antidote to all these viruses. However, within a few days of identifying the virus, various studies were started to stop it. The Chinese authorities quickly so leaked the genetic code of the virus. As a result, scientists can early figure out where the virus came from. How to control the outbreak as it spreads. How to protect people from this virus. Rapid decommissioning by government in various countries has made it possible to quickly take up the task of developing an Antidote to the virus. Scientists are hopeful that the human body will be able to start testing the Antidote in the coming summer. The purpose of making a possible Antidote in the invidious laboratory of Sanofi in the United States. Scientists have used relatively new types of DNA technology.

7. Conclusion:

Many scientists say that once the Corona virus is transmitted, it's less likely to be transmitted a second time. But if its antibodies last for three months in the mother, in that case, you can be infected again three months after the Corona virus infection. The possibility of eradicating the Corona virus forever is a huge blow. But scientists say that not what they're hoping for. It is said that cells and the human body develop immunity to the Corona virus and that it lasts much longer. Even those who did not develop antibodies to the Corona virus after ingestion. The T cell in his body acquires the ability to recognize and destroy the Corona virus. Multiple surveys have found such evidence.

CREATIVITY-A WAY OF STAYING POSITIVE DURING LOCKDOWN

Saheli Bera Khan

ABSTRACT

Creativity is a Way to make people confident in any difficult situation. This Creativity is the only way to keep yourself healthy from the lockdown that is currently going on around the world for COVID-19 with the help of these minds within the four walls can overcome this situation. Dancing, singing, drawing, reciting, writing - the creative joy in all of these things can take away the depression of the human mind. This creativity is in everyone. When a person unknowingly creates something and gets applause from everyone, he feels a sense of happiness, besides melody, rhythm keep the human brain much more alert. In a word people can keep themselves healthy both physically and mentally. Repeated hand washing, using masks, staying indoors, keeping distance from people - there are just as important as the need to be mentally healthy to recover from the panic of COVID-19. One of the divine feelings between regular art practice and constantly discovering oneself in new ways it to help keep any depressed mind a wake. If we can keep ourselves healthy in the current difficult situation through all these things, we will be able to win against COVID-19.

Keywords: Creativity, COVID - 19, Depression, Healthy

1. Introduction:

At present, when a person is phoned the warning of COVID-19 can be heard from the other end of the phone. This is what COVID-19 actually is? Why are people so terrified of COVID-19? COVID-19 means Corona Virus. Corona Virus is a class of Viruses and this virus causes human respiratory infections. And it flows through the infected person's sneezing, coughing up water. Information about this virus was unknown to scientists so it spread from china to different countries of the world very fast. It was never spread among people before. Another name for this virus is novel Corona Virus. In the second week of February named the disease COVID-19.

Lockdown is going on all over the world to save the whole country from this disease lockdown has been declared in our country by the government of India. Today, we have been under house arrest for the past several months. That is why we are separated from our work place. Friends and relatives. Today there are lockdowns all over the world so the pressure of online work is much higher among us but there is no way to reduce the pressure now. Because now all the coffee shop, hotels, park, restaurants are all the closed for lockdown. In such a situation, what we need most is to keep ourselves physically and mentally healthy, and the only artistic creativity sitting in this room, yoga, helps us to recover a lot from this stress. An unknown fear of this Virus has always plagued our minds. So by keeping our minds occupied with the joy of now creation, we can keep ourselves and everyone around us healthy and normal and we can stand up against this epidemic and win from this epidemic.

2. Symptoms of this disease:

- ❖ The main symptoms of this disease are fever, cough and respiratory problems.
- ❖ This Virus attacks the lungs of the human body.
- ❖ Although the symptoms are triggered by a dry cough and fever, the main problem later develops into the main respiratory tract.
- ❖ It takes an average of five days for the symptoms to manifest.
- ❖ The horrific outbreak and infection of this Corona Virus

reminds people of the SARS Virus. It appeared in many countries in Asia in the early 2000's. It also killed about 774 people.

3. The Source of this Virus:

Presumably or as far as is known the phenomenon was first seen in a market in the city of Wuhan, China, Where marine fish are sold wholesale. So, this is where the first human infection occurred. The first name of this disease was Corona Virus, China Virus, New Virus, Mystery Virus, etc. Etc. The Virus was given so many names because no information about it was known to scientists.

4. Ways to protect against this disease:

- ❖ First of all, to limit the association of people and to go out.
- ❖ Wash hands frequently with soap or hand wash and Sanitize.
- ❖ Treat patients separately and use protective clothing for health workers.
- ❖ Avoid going out of the house and even if you have to go out for special needs, you must use Mask and keep your distance from others.
- ❖ In case of Sneezing or coughing, cover the face with your hands and in that case handkerchief should be used.

5. What are the ways we can stay mentally healthy:

- ❖ If you keep yourself busy in regular art practice there is a different kind of happiness in body and mind. Because art is considered to be a technique to arouse happiness. Because the human brain works in rhythm.
- ❖ Writing about an event or a memories on a diary page keeps the mind healthy with the joy of creating a new language and the joy of talking to oneself.
- ❖ The mind stays good if you decorate yourself nicely with time.

Changing the daily routine of homework and experimenting with it reduces stress a lot. So all these dance - song - recitations - painting keep our minds energized and reduce stress. The dance keeps the body fresh with the mind. Dance has been born in human society as well as in nature since time immemorial and has

certainly been motivated by practical needs. That is so say for the collection of food, shelter and Clothing that the human race has had to struggle for ages, for practical needs. Yet beyond\ this need, with the advancement of society in human society, every industry has acquired a distinct and prominent character. As a result of with man has not only enjoyed himself, but has also shaped society and made the society much more cultural and prosperous.

So in any situation, no matter how difficult the time may be, by overcoming all the monotony and stress people can save themselves with a smile, they can save everyone.

It is the artistic consciousness that brings a smile to the face, gives joy to the mind, and realizes a divine at even in the midst of hundreds of hardships. His art has kept the flow of human emotions infect, so people cry with an open mind and shake off all depression and move on to the future. This love, sorrow, joy is the only medium of expression. So in the joy of this new creation, people like the creator can rise and overcome all obstacles, all depression.

The art of dance is called - 'Mother art' Dance has been a means of expressing one's thoughts since the first part of one's life. Syed Muytaba Ali, in his essay on 'Indian Dance' - Says that Dance is the ultimate development of life force. It is through this choreography that people express their seance0 of beauty and breathe life into the original choreography.

6. The Cause of emotional Change through dance and song:

- ❖ According to researchers, the work of the human brain is rhythmic. Brain Cells awaken memory in the rhythm of the song, while physical exercise through dance makes our nervous system much more active.
- ❖ Listening to music produces alpha and beta waves in the brain. It enhances memory as well as calms the brain.
- ❖ The brain of those who sing, play and dance are much more active than listening. Because they always play with the rhythm.

- ❖ The rhythm of the melody does not allow people to be brutal. Makes people kind. Because through it man gets the pleasure of creative power.
- ❖ Music is now accepted as an alternative to medicine in neuroscience. Now the brain of come or dying patients is treated through headphone therapy.

Studies home shown that if a person can sweat regularly and dance for half an hour, he will never home to worry about his body. Not only this, with the help of this medicine you can get rid of many deadly diseases. At the same time, the age of body and mind begins to decrease. During the dance, the blood flow to every part of our body increases. At the same time, the oxygenated blood flow to the brain also increases. As a result, cognitive function in our brain improve and memory intelligence develops. On the other hand, the capacity of the heart and lungs also increases a lot. Which is very much needed in this situation.

7. Conclusion:

In this lockdown period different people have resorted to different ways to keep themselves healthy in different ways. Some go out of their daily routine to draw pictures, read story books, or spend their time dancing or singing. Many have taken their place in this case through social media. Some are standing by the starving people at this time.

All of this continues to play an important role in keeping the body healthy and reducing traces. And as long as the body and mind are strong, no depression can come close to us. And if this depression is overcome and the necessary restriction are followed, we will all one day be able to overcome the terror of this deadly disease. We will live a healthy normal life again just like before. Spending this lockdown period through creative work will make it much easier for us to stay mentally healthy.

Creativity -A Way of Staying Positive During Lockdown

Mr. Bhaskar Pal

ABSTRACT

Due to corona virus (COVID-19), the whole world is now affected. We are not get rid of from this COVID-19 till now. The whole world is trying to recovering from this pandemic situation but till not succeed. We are all hopeful that once this situation will be end and all the things will be same as before. I gratefully thanks to all the doctors, police, scientist and related person of whole world for their sacrificing and war against COVID-19.

During these Lockdown condition undoubtly there was a big problem of staying positive in home. Because the whole world is now lock, so there was no chance to do something at outside. Also we know that, staying home is the best weapon to protect this COVID-19, so in this condition staying positive is a very important for the human beings. Also staying positive in home is necessary for human mental health and Physical health. According to me, there is various way of staying positive during lockdown. Now I discussing some creativity of staying positive. These will be as soon as below.

- I. At first you must have to Healthy by mentally and physically. For being healthy we have to do some daily exercise, yoga etc and also take some needy fruits, food etc.*
- II. For staying positive and healthy, do everything which you want, you also want to sing a song, listening song, watching movies etc.*

- III. You also wants to program a tree plantation programme in your home garden.*
- IV. In this Pandemic condition many poor peoples are workless. They do nothing. So helping them by giving some food, ration, money etc.*
- V. For staying positive, you also want to play some indoor games in your home.*
- VI. For being positive, we also want to communicate to our relatives, friends and the needy person by mobile phone calls and talk to them.*
- VII. Maintaining safety, talk to the poor people who were workless, jobless in this situation. Then if possible helping them by any way.*
- VIII. You also wants to read books, writing poem, story essay etc for staying positive. You also wants to draw some picture.*

Keywords: Creativity, Corona, COVID-19, Weapon, Mental Health,

Physical health, Workless etc.

1. Introduction:

Due to corona virus (COVID-19), the whole world is now affected. It also create a pandemic situation in whole world. In these situation the poor people were badly affected in economically. The world is also affected in economically. But we are not get rid of from these pandemic situation still now. The whole world is trying to recovering from these situation by discovering vaccine but till not successes. We are all hopeful that once this situation will be end and all the things will be same as before. First of all I gratefully thanks to all the doctors, nurse, medical stuff, scientist, police and related persons of whole world for their sacrificing and war against these COVID-19. These COVID-19 is an unknown virus. W.H.O. says that these virus create a pandemic. Due to these virus a large number of people were died and also a very big number of people were affected. So according to medical science, staying home is the best option to

protect these pandemic situation. In this condition staying positive is very important for the human beings. Also staying positive in home is necessary for the human mental health and Physical health.

2. What is COVID-19?

On December 31, 2019 a new pandemic case of unknown cause was reported to the Chinese WHO country office. These cases was originally appeared in Wuhan, a city of China. Due to a new coronavirus these infection were increasing rapidly, these virus was given to the name” 2019 novel coronavirus”(2019-nCoV).

Next to that it was renamed “severe acute respiratory syndrome coronavirus 2” by the International Committee of taxonomy viruses on February 11,2020.It was renamed to SARS-CoV-2 because these virus is a genetic form of coronavirus, as a result the SARS outbreak in 2002.The unofficial name of this virus is “the COVID-19 virus”.

3. How does the diseases spread?

These virus initially spreads through respiratory droplet of infected people. If a healthy man touches a surface or a body that has been already infected by the COVID-19 virus and then if this person touches his own mouth, nose or eyes. As a result this person may effected by the virus.

4. Who will be affected?

People of all ages can be affected by the virus. The people of having ages 80 and its above are at highest risk of dying due to COVID-19, according to analysis record of China and South Korea. If a person already having cardiovascular diseases and diabetes are infected by the virus, then there will be higher risk of dying.

5. What are the symptoms?

According to the guidelines of Union Health Minister after recognition of COVID-19 patient that those people are affected by these virus having contact with another people who also have a history of foreign traveler’s per guidelines of COVID-19,the people having mild, moderate or severe illness are a risk of affection by these virus.

6. What is the treatment?

There is no present evidence from randomized controlled trial

to recommend any specific treatment for suspected or confirmed COVID-19 patients. No specific anti-viral are recommended for treatment of those suffering from respiratory ailment due to lack of adequate evidence from medical literature.

7. Barrier:

Due to large spreading of these virus, the government taking a number of decision. One of the most important decision is total lockdown. According to WHO, the best weapon to protect these virus is lockdown? So now the government takes these decision and after all we are all in home now. Undoubtedly, during these lockdown condition there was a big problem of staying positive in home. Because the whole world is now lock. So we are not allowed to go outside from home. There was no chance to do something at outside. Also we all knew that staying home is the best weapon to break the spreading rate of these COVID-19. According to me there is a number of barrier of staying positive in home during this lock down. Now I discussing some barrier of staying positive during lockdown. This will be as soon as below.

- ❖ There was a large number of negative information or fake news about the COVID-19 is spreading in all over this social media and also in news channel. Our mind is absorb this negative information and think about it. Hence we are depressed.
- ❖ In case of poor peoples, they have no enough money to spend a long of days without any work. So they suffered most in this lockdown condition by their work.
- ❖ Due to lockdown all the School, college, government and private institutions are closed. So the students and as well as teachers also are all in home. So there was no chance to go to school for learning and teaching also. So our education system is now hampered. Although our education system is continuing buy online mood.
- ❖ Sometimes for staying positive many peoples wants to go in any tourist place for a few days. But due to lockdown all

the Transportation system is now stop. So you can't go anywhere where you want to go.

- ❖ Due to lockdown we are not able to communicate with our relative persons and as well as necessary persons by face to face. For while we are not staying positive during lockdown.

8. Some tricks of staying positive:

There was various number of ways of staying positive during lockdown. When the whole world was embarrassed by the virus then it is really quite difficult to staying positive. We heard various news of death and infection of virus from daily newspaper and T.V. and also takes energy from us .To be able to stay positive in such hard times takes every ounce of energy within us. Most of the news related to virus are inversely affecting the major cities, business, economics and normal life. During these hard time it is not an easy of strongest among us.

Now it is awareness to all of us that you have not to worry by hearing each article of news or every new fact of the fast spreading of COVID-19 virus. If we absorb all the information about spreading of these virus then it is really harmful for our mental and as well as physical health. There are various powerful number of way for staying positive during lockdown.

7.1 Being healthy: At first you must have to Healthy by mentally and physically. For being healthy we have to do some daily exercise, yoga etc and also take some needy fruits, food etc.

7.2 Limit your intake: Reading News in mobile phone. Most of the people have learn about dangerous of coronavirus from news. So every time you have to refresh your mind and see a new article. You must have to avoid to looking up 24 hours news channel every time. You have to choose a single news channel how much limited time you will spend with it each day.

7.3 Understand your strength: Resilience is very important at this time. You are stronger than you know. In this pandemic condition we are really helpless as the pandemic condition affecting us economically. But we are hopeful that there are some way to be

strength us. So you have to do anything to increase your strength by realization from your past resilience.

7.4 Laughter is the best medicine: Dog videos are always funny, right? And always helpful to take your mind off of stressful things. Stressed at work? Then see a funny video to be relax. Got an exam and need to take a break? Watch a fun video. The pandemic condition may affect your spirit. Watch a fun video. Happiness may be found even in bad times if you want to turn on your happiness.

7.5 Extend a hand to those, who need you: If your immune system is able to put up a fight against coronavirus, understand that you are incredibly lucky. You may be at a low risk of consequences, but there are many who aren't that lucky. Many people's physical and mental health are also compromised. Helping them when they need you also can be dangerous for them. At first, you checked on them (keeping six feet apart, of course) then you may help them by any way so that they felt that they are not alone in this hard time.

7.6 Support your favorite local business: Since the lockdown, many restaurant and cafes are closed across all over the country, most small business have taken a hit. They are struggling to keep the restaurant in business and provide for their staff. You could support your favorite outlet by donating directly to their websites. Many dinning out apps have also begun distributing gift cards which can be purchased now and used later when the situation gets better.

7.7 Utilize the time you have found: Learn a new skill during this lockdown. There is an abundance of time, now that we are all in home now. For most of us, each day is a question of how to pass the time effectively and not keep lying on the couch every time. In this lockdown condition you have more times. So Pick up a new goal or hobby or old wishes and do that, stay happy during this lockdown. Understand that this is also a time of crisis not a vacation. So if you have a time for new hobbies that was wonderful. But it is also wonderful if you take time out for yourself. Just because you can't physically chart your inner growth, it does not mean you are not doing great. So learn a new skill or take care yourself first.

7.8 Practice random act of kindness: Leave an envelope with a little gift for the Amazon, swiggy, flipkart etc delivery person who drops off your supplies outside your door. Write an unsolicited book review for a friend who is an author. Send a note of appreciation to a friend or colleague. Thank to security guard in your locality building or workplace for their efforts to keep things safe. Thanks to the essential worker who are working for you day and night.

7.9 Take a daily inventory: Chose your day, every day, with a positive acknowledgement of something you have done, learned or are grateful for. It will help dilute some of the negativity you have absorbed and reminds you that not everything happening right now is bad or depressing.

7.10 Plan a tree Plantation: You would also want to program for a tree plantation in your home garden. Plant some new flower trees and other trees also.

Economy and its Impact on individual During Lockdown

Aparajita Khamrai

1. Introduction:

The COVID-19 pandemic in India is a chunk of the world wide pandemic. The positive first case of COVID-19 in India is found in Kerala which originated from China, was reported on 13th January 2020. In India highest number of confirmed cases are found in Asia and the highest third number of definite cases in the world after the America and Brazil with the number of Total cases break through and 1000000 confirmed cases on 17th July 2020.

The economic impact of coronavirus pandemic in India has been mostly troublesome. India's growth of the fourth quarter of the physical 2020 went down to 3.1 % according to the Indian ministry of statistics. The chief economic advisor of the government of India said that this drib is primarily due to the coronavirus influence on the Indian economy. Remarkable, India had also been wintering a contagion so down, and according the World Bank, the current has" magnified pre-existing pongs to India's economic View".

2. Economic situation:

- ❖ By FICCI SURVEY in the month of March up to 53% of business in India has specified and definite percentage of it come to be downward due to impact of COVID-19? The employment frequency has been decreased nearly 19 % within a month, and it became 26%, a huge unemployment

situation across India. More than 14 cores Indians lost earnings during the lockdown period up to 10th May, 2020.

- ❖ Various businesses such as hotels and airlines cut salaries and lay of employees. The tourism industry will be faced approximately the amount 15,000 corer only in the month of March & April' 2020.
- ❖ A number of new start-up has been obstructed as capital has collapsed. Data labs report shows 45 degrees is in the total progress stage of funding as likened to Q4 2019.
- ❖ According to the KPMG reports venture, 50% of total start-up capital in India has fallen in Q1 2020 from Q4 2019. Indian economy expected to less over 32000CR every day in first 21 days of lockdown, according to acquit.
- ❖ Barclays says that the cost during total lockdown period is around total sum of 8.5 lakh crore. Association of Indian Industry heads, south, a monetary stimulus package of 1% of India's GDP amounting to 2 lakh crore. Zafar is group say that the government can expend 1.3 lakh crore to combat against the coronavirus. Former C.E.A. Arvind Subramanian said that India needs a 10 trillion incentive to overcome the retrenchment.

3. Rating and GDP estimates:

On 27th March 1 day investor service received the estimate of India's GDP growth for 2020 from 5.3 % to 22.5 percent. Fitch ratings received its pointed estimate for India's growth to 2%. 'India ratings and research' also downgraded the FY21 estimate to 23.6 percent. In April 2020 the World Bank and assessment agencies downgrade 8 Indians growth for financial year 2021 with the bottommost figures India has been seen in three spans since India's economic liberalization in the 1990s. On 12th April 2020 a World Bank report concentrating on South Asia, assumed that Indian economy is estimated to develop 1.5 % to 2.8 % for financial year 2021.

The pandemic has magnified pre-existing risks to Indian economic Viewpoint. The International economic fund projection of India projected for the financial year 2021 of 1.9 % GDP growth has

what's steel the highest among G20 Nations. Configuration of Indian industry estimated that the India's GDP for fiscal year 21 will be between 0.9% and 1.5 %.

4. Energy:

Night light and economic activity are connected. In Delhi night light radiance fall 37.2 percent compare to 1-31 March 2019. This was the biggest fall for any metropolitan city in India. Bangalore fall into 32% while Mumbai dropped by 29%. India has 56% demand of fuel is reduced in April 2020 in comparison with last year. The Consumption in nearly parallel with the year of 2007.

5. Agriculture:

During the first two weeks of May the public health foundation of India noticed that a majority of farmers are facing difficulty for the next agricultural seasons. Due to Logistical problems the tea estate was unable to grow fast flush. The whole Darjeeling district is a tea based industry will face a huge loss of amount approximately of 8% as a result. Tea export from India fell into 33% in March as compared to March 2019.

6. Exports and Imports:

India's exports in April 2020 fell by 36.65% year -on -year. While imports in the month of April, 2020 fell by 47.36% as compared to April 2019.

7. Manufacturing:

Mature companies in India at Larsen and Toubro, Bharat forge, Ultra Tech Cement, Grasim industries the fashion and retail wing of Aditya Birla Group, Tata Motors and Thermax temporarily suspended or significantly reduced operations in a number of manufacturing facilities and factories across the India. Nearly all two wheeler and four wheeler companies put a stop to production till further notice. Many companies have decided to close their industry till the date of 31st March. Hindustan Unilever, ITC and Dabur India Ltd shut manufacturing facilities expect for factories producing essentials.

8. Stock market:

On 23rd march 2020, stock markets in India post worst lesson in history. Sensex fell 40000 points (13.15%) and NSE NIFTY fell

1500 points (12.98%). However 25 March, one day after a complete 21st day lockdown was announced by the Prime Minister, Sensex posted its biggest gains in 11 years, adding a value of 4.7 lakh crore for investors. On 8th April following positive sign from the Wall Street that the pandemic may have reached its peak in the US, the stock markets in India Rose steeply once again. By 29th April, Nifty held the 9500 marks.

9. State Income and Expenditure:

State government suffered a huge losses to the range of having to cut funds outlays as well as government plans in the near future and finding substitute methods to pay salaries. The Delhi government has short fall of 90% in tax collection comparing with 2019 and is scheduling to take loans and increase taxes in definite segment. Maharashtra put a hold on all new capital works till March next year. Spending under Government development scheme has been reduced by 67% for the current financial year.

The Delhi government as well as the Andhra Pradesh government imposed a 72 -75% “Corona” extra tax on liquor. Exercise duty on liquor is the 3rd largest source of income for a number of states, nearly 10 % to 15% of total tax collector for some States. The ban during in lockdown affected alcohol sales, in turn having a major effect on the state revenue.
